**Can rhythm control strategy reduce the risk of
clinical and silent cerebral ischemia?**

Prof. Fiorenzo Gaita

**Director of the School of Cardiology
University of Turin, Italy**

Disclosure form

Economic

No conflicts of interest related to this topic to declare

Ideologic

YES

Two reasons to pursue rhythm control strategy

If we have been created in sinus rhythm there must be a reason

Faith

For 2 millions years in the evolution of the human species sinus rhythm has always been maintained

Rational

Atrial fibrillation therapy: Aims

Symptoms relief and quality of life

Reduction of related major comorbidities
e.g. clinical (stroke/TIA) and “silent” cerebral ischemia

Reduction of mortality

TE event rate observed per 100 pts/yr

**What about
silent cerebral ischemia and
cognitive decline?**

Atrial fibrillation and incident dementia

5.150 pts, mean age 73 yrs, Male 41%, Hypertension 57%
Not having atrial fibrillation or a history of stroke at baseline

Conclusion:
Patients with AF have a cognitive performance comparable to that of those with at least five years older

Mean follow-up 7 yrs

Cognitive test performed annually

Above 70 yrs of age
cognitive performance
physiologically declines

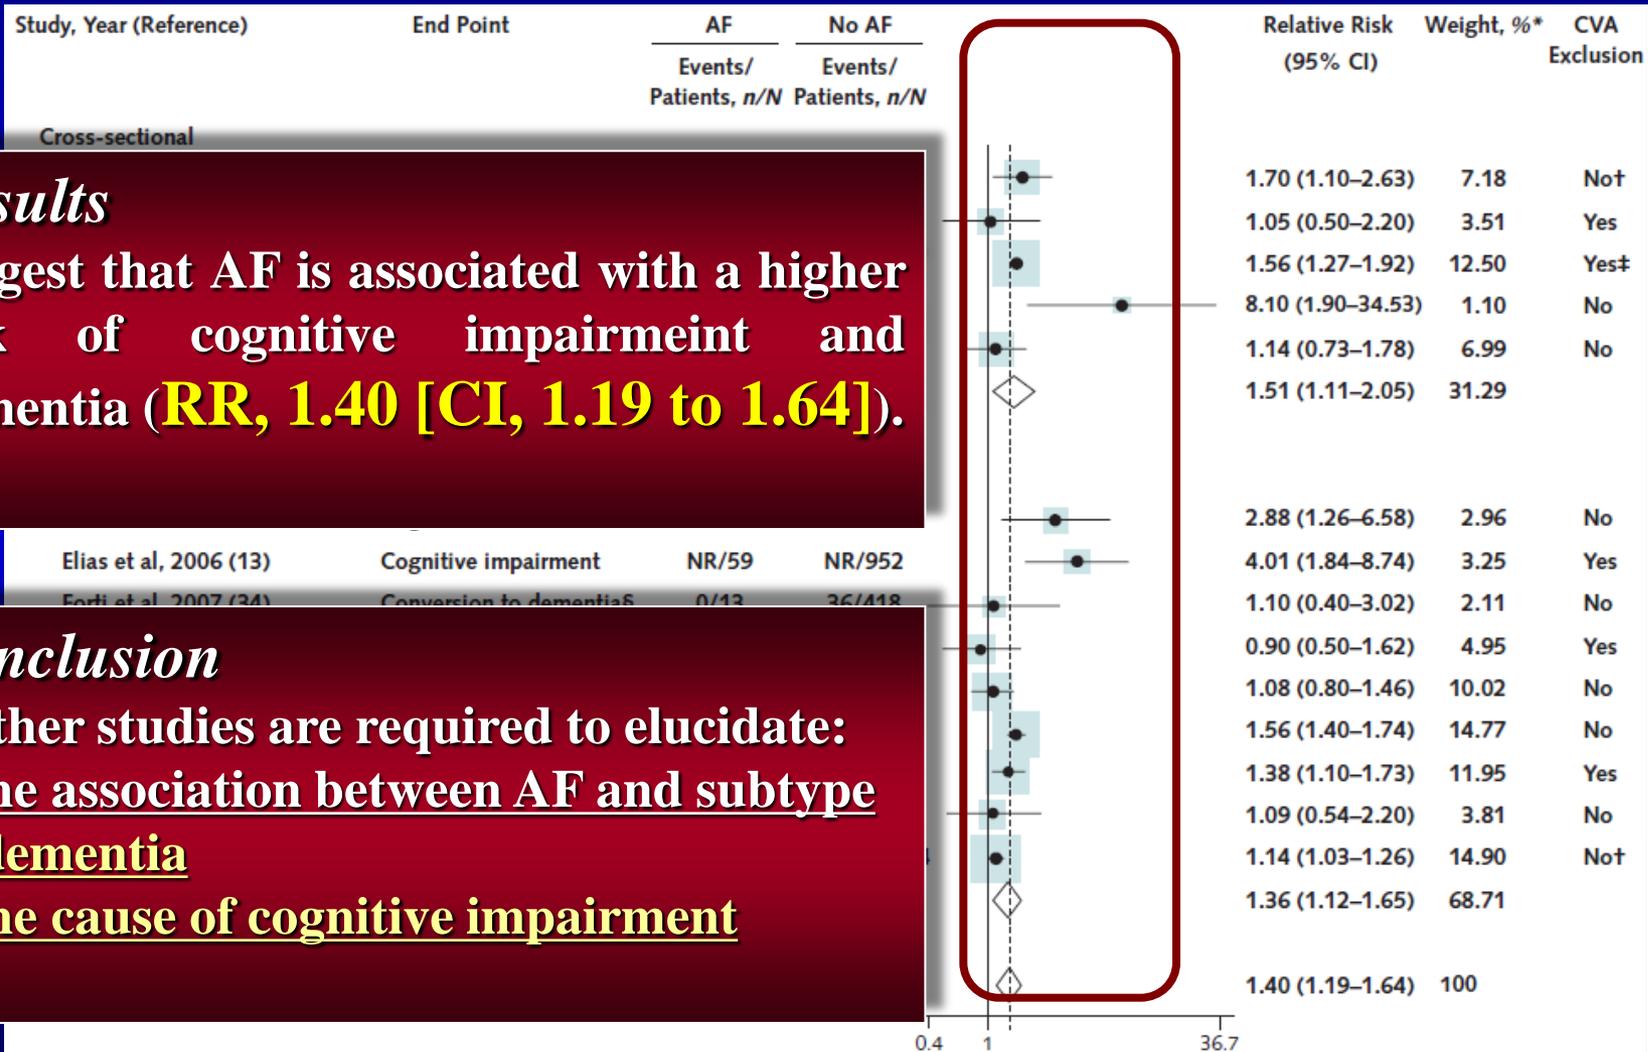

AF onset accelerates
cognitive decline

Cognitive Impairment Associated With Atrial Fibrillation

14 studies. Tot pts 85118 AF patients 14147 No AF patients 70971

Results
 suggest that AF is associated with a higher risk of cognitive impairment and dementia (RR, 1.40 [CI, 1.19 to 1.64]).

Conclusion
 further studies are required to elucidate:
 - The association between AF and subtype of dementia
 - The cause of cognitive impairment

Prevalence of Silent Cerebral Ischemia in Paroxysmal and Persistent Atrial Fibrillation and Correlation With Cognitive Function

Fiorenzo Gaita, MD,* Laura Corsinovi, MD, PHD,* Matteo Anselmino, MD, PHD,*
Cristina Raimondo, MD,* Martina Pianelli, MD,* Elisabetta Toso, MD,* Laura Bergamasco, PROF,†
Carlo Boffano, MD,‡ Maria Consuelo Valentini, MD,§ Federico Cesarani, MD,||
Marco Scaglione, MD¶

Turin, Milan, and Asti, Italy

Controls

Paroxysmal AF

Persistent AF

Undergone to cerebral MRI

SCI

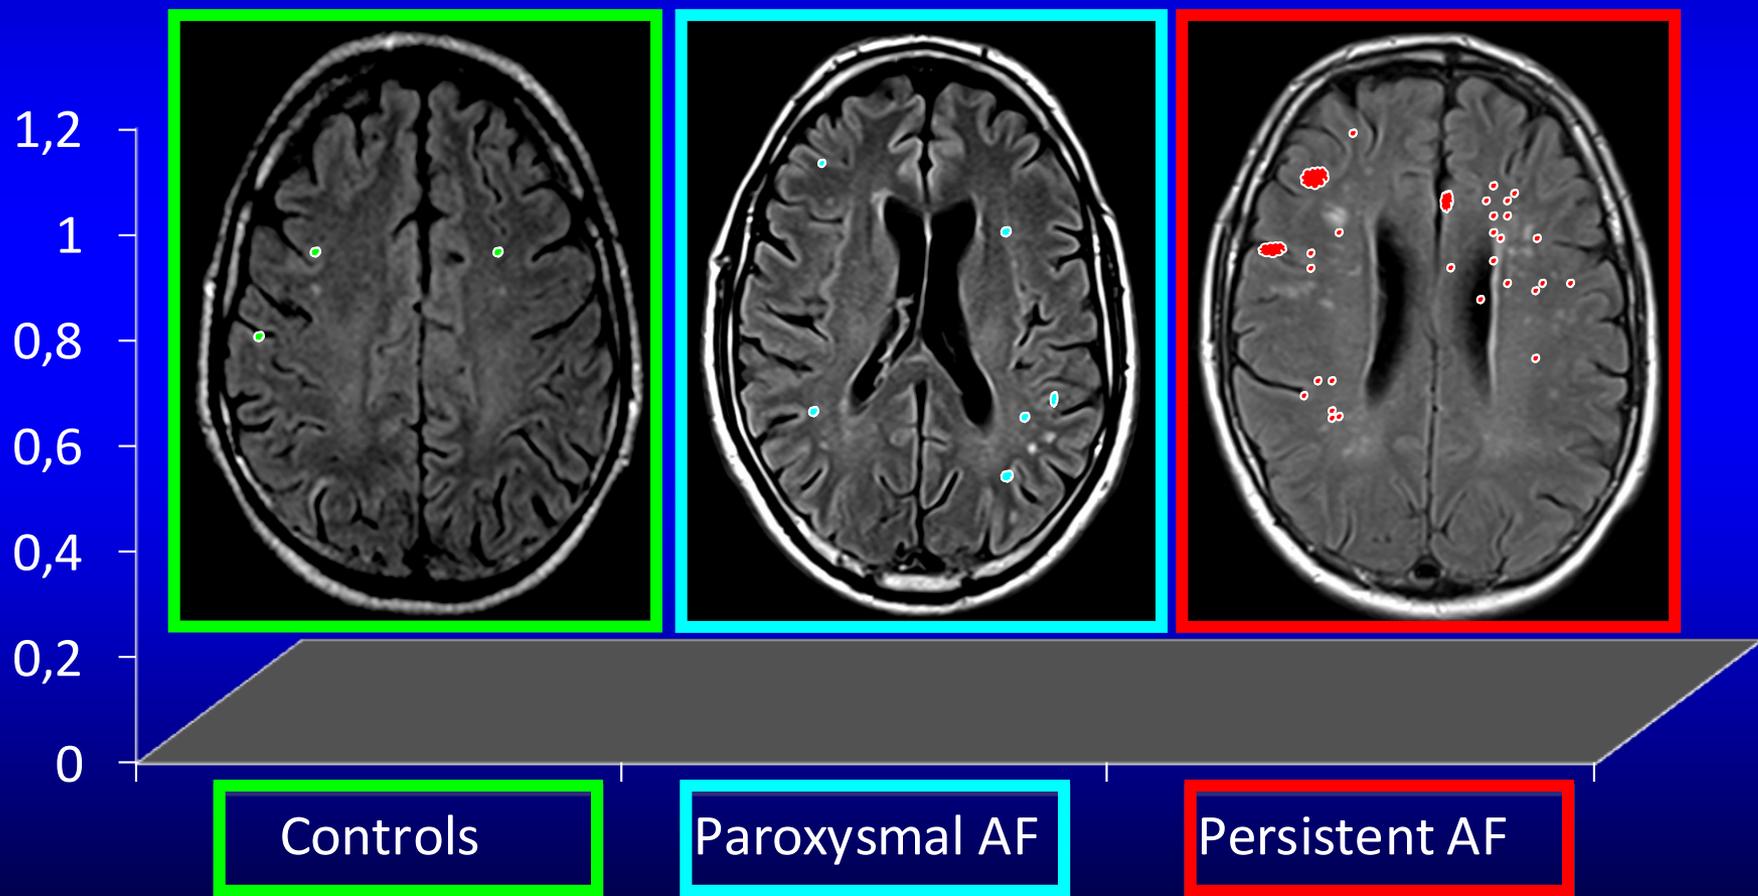

Cognitive test

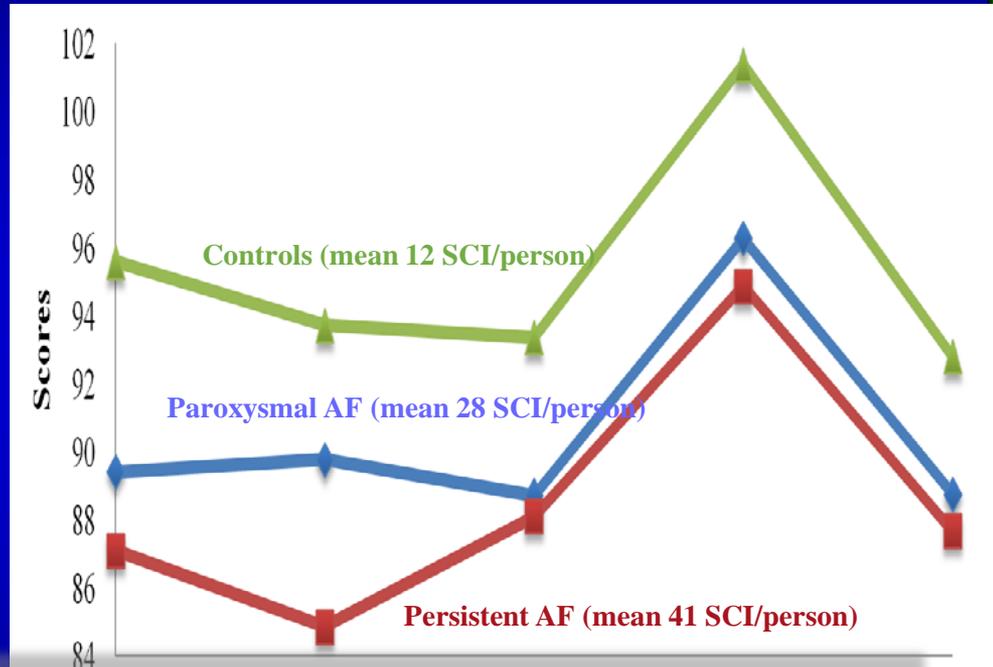

Cognitive decline

The number of SCI varies according to AF type

AF showed a higher risk for SCI compared with subjects in sinus rhythm (**Odd ratio 11.2, p value < 0,001**)

Correlation between AF type, SCI number and cognitive function

An increased burden of SCI relates with worse cognitive performance

5
played
mory

Conclusion

Thank you for your attention!

Rhythm control strategy associated with well-managed OAT can further reduce thromboembolic events in patients with AF

Further clinical studies focusing on oral anticoagulation and rhythm control strategy are warranted to evaluate their impact on silent ischemia and cognitive decline
