

Sudden cardiac death in “healthy” heart

Torino, 27th September 2013

Prof. Fiorenzo Gaita

Director of the Cardiology School - University of Turin, Italy

2010 – M.Garcia, 31 y, ???

2003 – M.V.Foé, 28 y, hypertrophic CMP

2012 – V.Bovolenta, 38 y, ???

2012 - Morosini, 26 y, ARVD/C

Un uomo di nome Anania con la moglie Saffira vendette un suo podere e, tenuta per sé una parte dell'importo d'accordo con la moglie, consegnò l'altra parte deponendola ai piedi degli apostoli. Ma Pietro gli disse:

"Anania
ment
Prim

Anania cadde a terra e spirò

non era sempre a tua disposizione? Perché hai pensato in cuor tuo a quest'azione? Tu non hai mentito agli uomini, ma a Dio". All'udire queste parole, Anania cadde a terra e spirò. E un timore grande prese tutti quelli che ascoltavano. Si alzarono allora i più giovani e, avvolto in un lenzuolo, lo portarono fuori e lo seppellirono. Avvenne poi che, circa tre ore più tardi, entrò anche sua moglie, ignara dell'accaduto. Pietro le chiese: "Dimmi:

D'improvviso Saffira cadde ai piedi di Pietro e spirò

via anche te".

D'improvviso Saffira cadde ai piedi di Pietro e spirò. Quando i giovani entrarono, la trovarono morta e, portatala fuori, la seppellirono accanto a suo marito. E un grande timore si diffuse in tutta la Chiesa e in quanti venivano a sapere queste cose.

Atti degli Apostoli cap. 5 vers. 1-11

1985: 20 year old man, professional runner.

**Symptomatic for palpitations, pre-syncope
and one syncopal episode. Father died of S.D.**

Narrow, tall and peaked T waves QT 280 ms QTc 260 ms

AF with coarse and regular f waves

Our diagnosis was:

“Episodes of vagal atrial fibrillation and flutter due to short atrial refractory periods (150ms) in a patient with syncope, short QT and family history of S.D.”

Therapy: Flecainide and yearly follow-up were suggested

...16 years later....

2001: 31 year old woman, symptomatic for palpitations and pre-syncope.

No structural heart disease. Father died of S.D.

Short QT : therapy

How to manage **symptomatic** patients
(ACA or syncope)?

In pts with aborted cardiac arrest or syncope, ICD
is presently the first-choice therapy

Hydroquinidine must be proposed:

- those who refuse ICD
- those who experience frequent ICD shocks
- where ICD is not available
- very young patients (bridge to ICD)

Short QT : therapy

How to manage **asymptomatic** patients?

As we have not yet definitive data on predictors of SD, prophylactic treatment with **Hydroquinidine** should be proposed in adult patients from highly symptomatic families, and in newborn or children

Europace 2009; 11 (4): 507-13

Aims

Risk stratification of patients with Brugada electrocardiogram (ECG) is being strongly debated. Conflicting results have been suggested from international registries, which enrolled non-consecutive cases, studied with different programmed electrical stimulation (PES) protocols. The aim of this study was to prospectively evaluate the incidence of arrhythmic events and the prognostic role of clinical presentation, ECG, and of a standardized PES protocol in consecutive cases from a community-based population.

Methods and results

A total of 166 consecutive patients (45 ± 14 years) with Brugada ECG were enrolled. Type 1 ECG was observed spontaneously in 72 (43%) and after pharmacological testing in 94 (57%). One hundred and three (62%) were asymptomatic, 58 (35%) had syncope, and five (3%) had a prior cardiac arrest. One hundred and thirty-five (81%) underwent PES with two extra stimuli up to ventricular refractoriness and 34% had ventricular fibrillation (VF) induced. Arrhythmic events occurred in nine patients at a mean follow-up of 30 ± 21 months (2.2 events per 100 person-year): in three (60%) patients with aborted sudden death (aSD), five (8.6%) of those with syncope, and one (1%) of the asymptomatic. The only predictors of events were a history of syncope or aSD ($P = 0.02$) and induction at PES ($P = 0.004$).

Conclusion

Clinical presentation is the most important parameter in the risk stratification of patients with Brugada ECG. Programmed electrical stimulation seems valuable, particularly in patients with previous syncope.

Long-Term Prognosis of Patients Diagnosed With Brugada Syndrome

FINGER study: predictors of cardiac events

Event rate per year during 32 months of median f-up

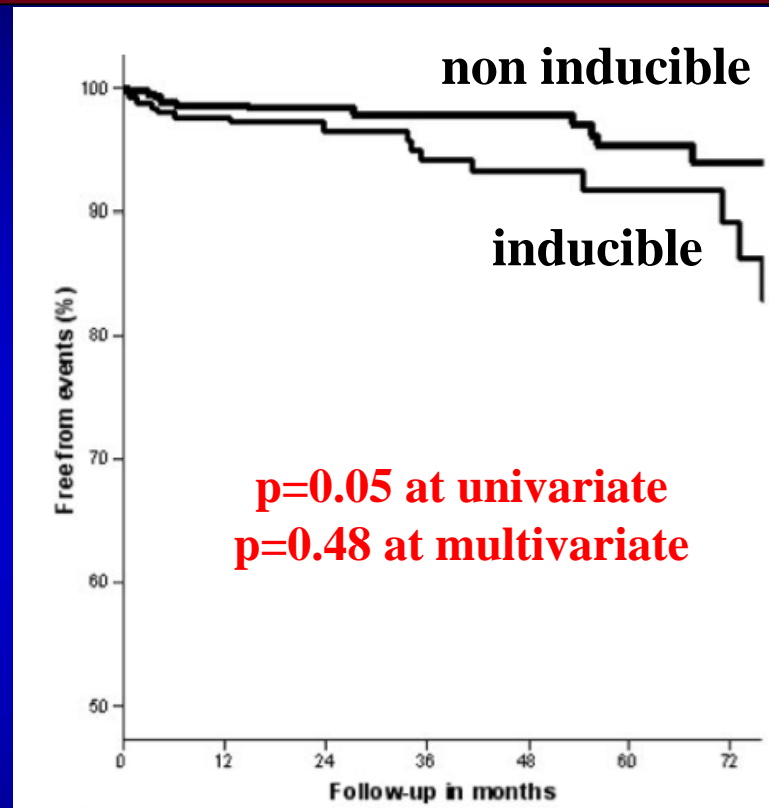

**Symptoms and spontaneous type 1 ECG
were predictors of arrhythmic events**

FINGER study: predictors of cardiac events

NO predictive factors in asymptomatic patients

- Spontaneous *vs* drug induced type 1 ECG ($p=0.26$)
- Male *vs* female gender ($p=0.35$)
- EP study result ($p=0.83$)

Role of electrophysiological study (EPS) in Brugada patients is debated

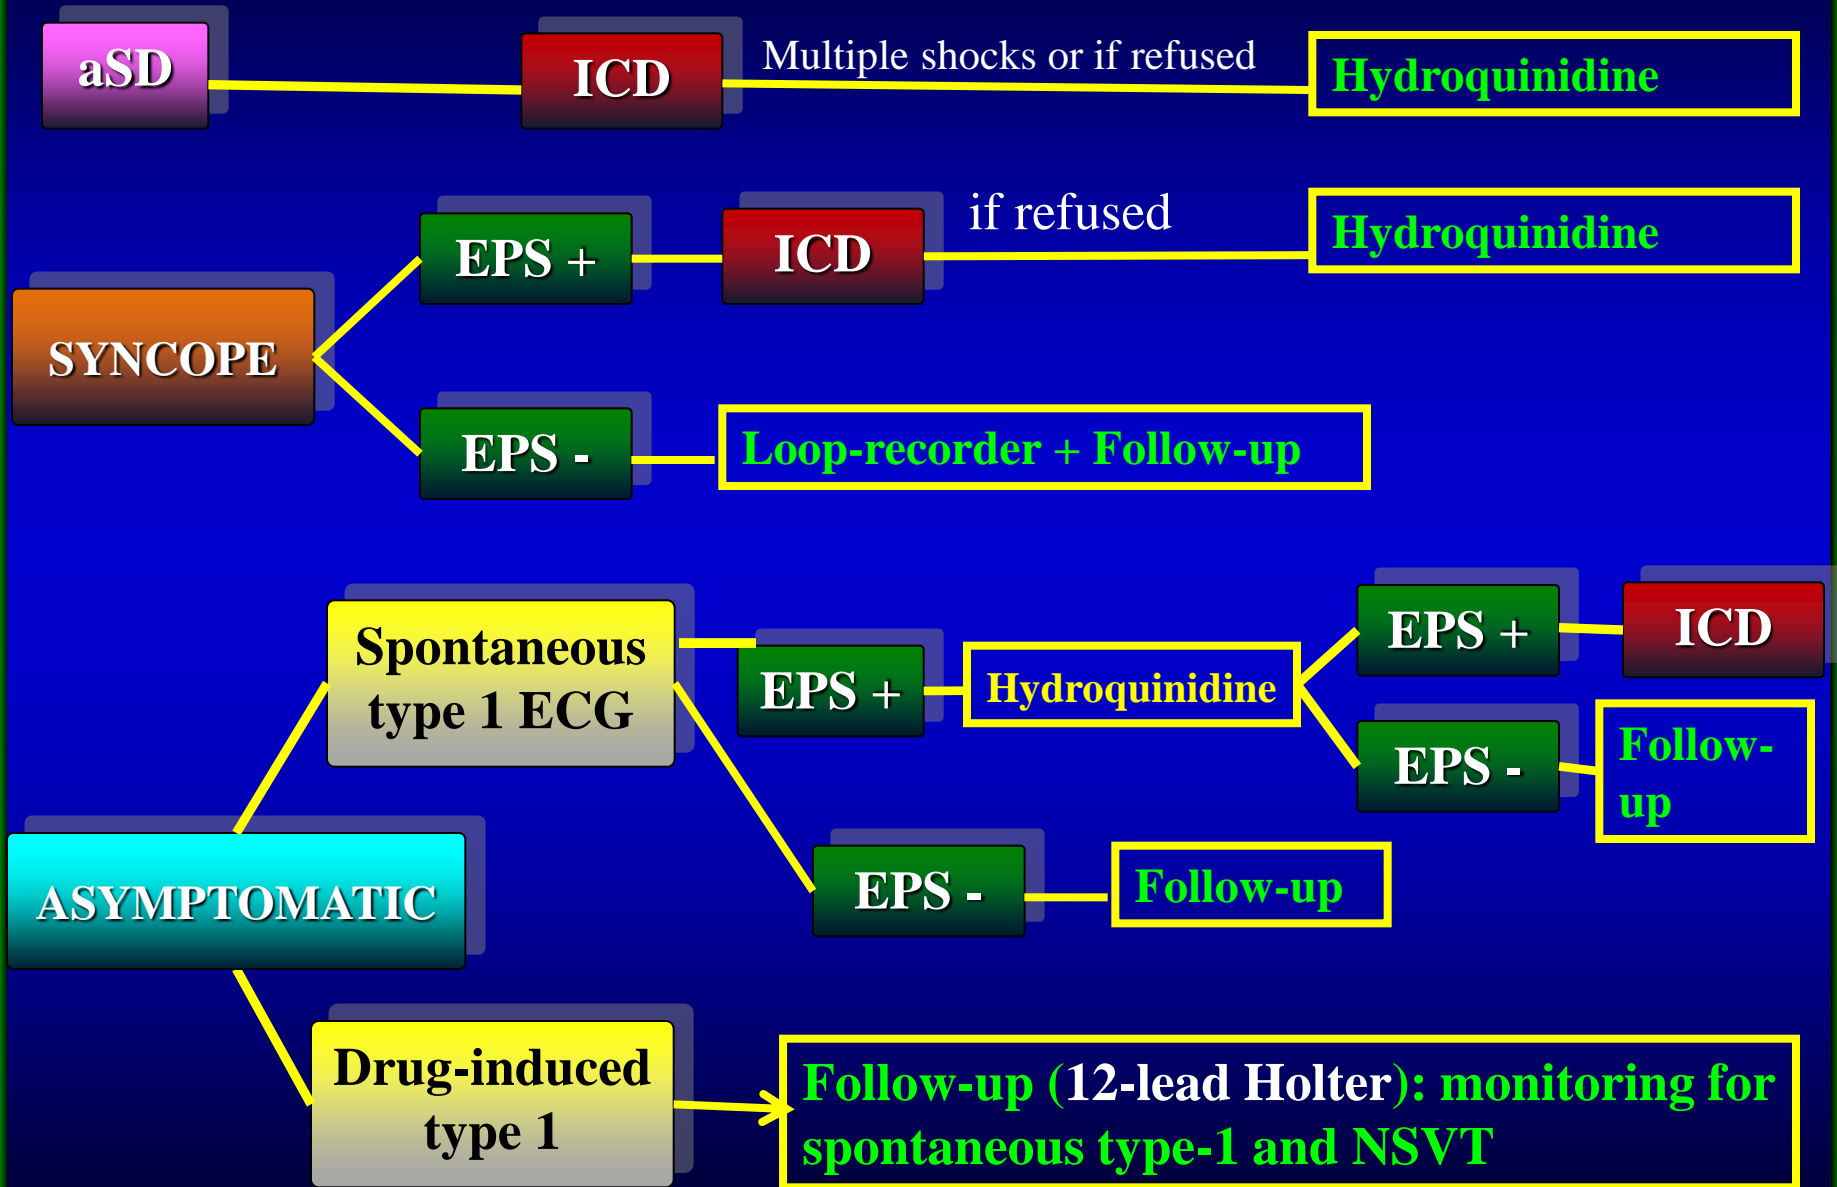

547 pts { **23% syncope**
70% spontaneous type 1 ECG

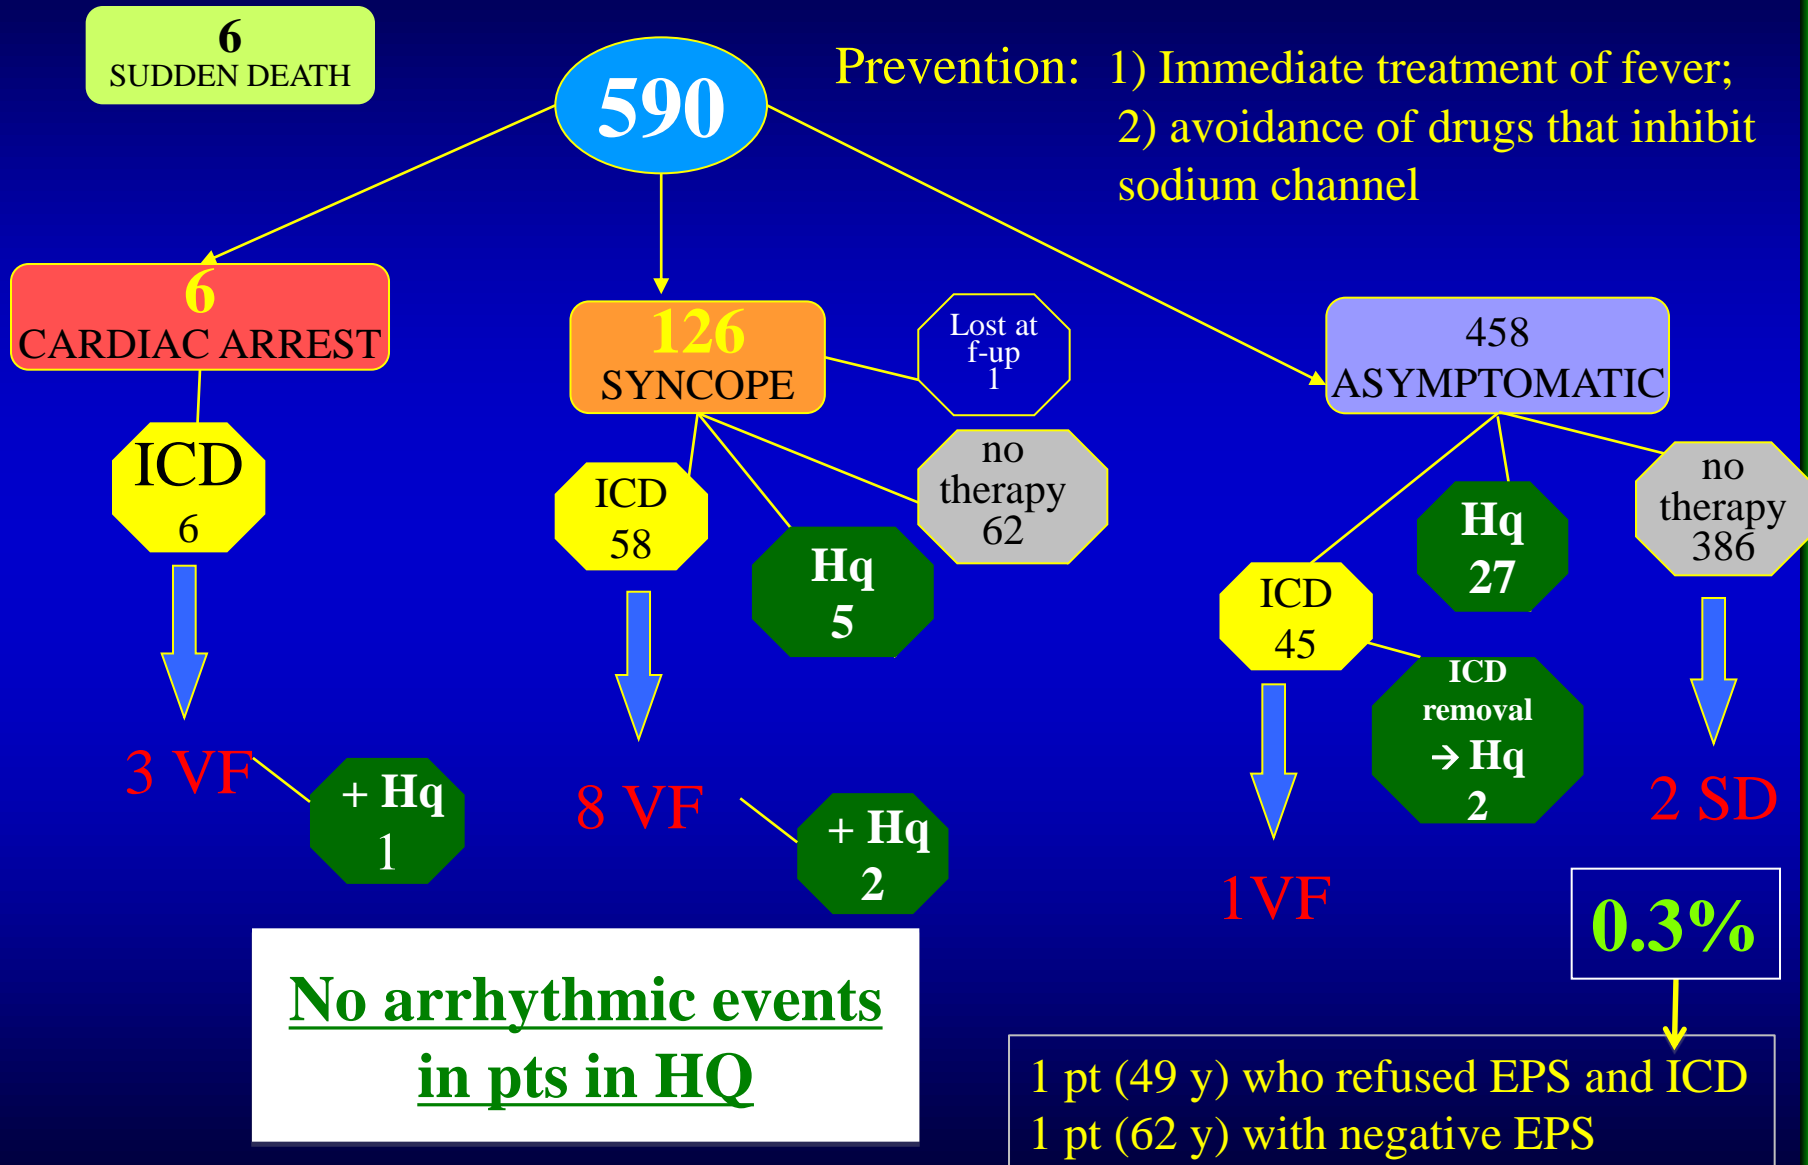

1029 pts { **30% syncope**
45% spontaneous type 1 ECG

Management of Brugada pts

596 pts in the Brugada Piedmont Registry (2001-2013)

How to identify subjects at risk for sudden death?

Rule out structural heart disease:

- **Cardiological examination**
- **ECG analysis**

Impact of cardiovascular screening in competitive athletes

Reduction of sudden deaths in young athletes=

89%
