Heart and kidneys: Renal denervation as therapy for hypertension

Renal sympathetic innervations and atrial natriuretic control. Without preventing atrial electrical remodeling, will renal denervation provide effective ventricular rate control during atrial fibrillation?

POLYURIA IN PAROXYSMAL TACHYCARDIA AND PAROXYSMAL ATRIAL FLUTTER AND FIBRILLATION

BY

PAUL WOOD

Br Heart Soc 1961

the mechanism of the diuresis was obscure

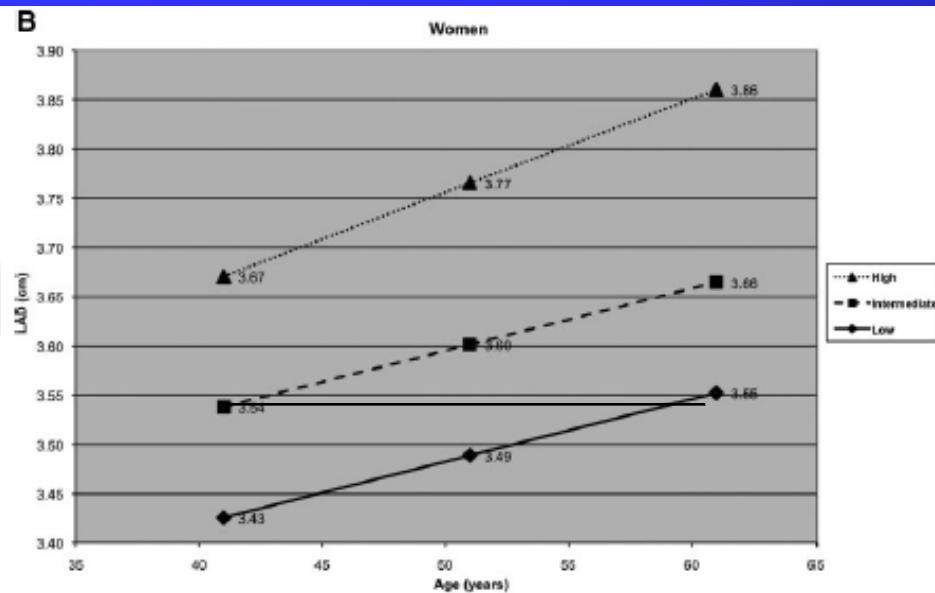

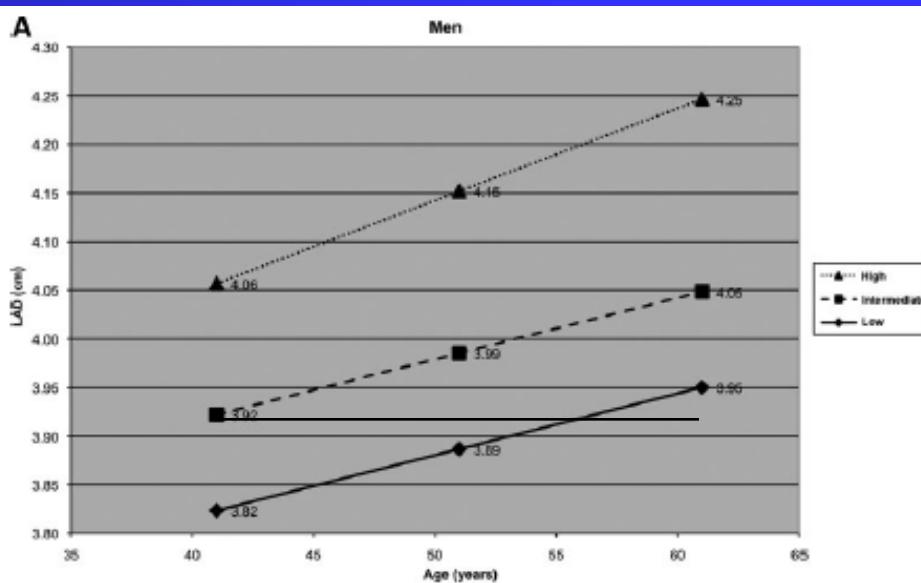

Campbell M Br H J 1962

The phenomenon seems little known. Thus Paul White (1951) says “An occasional symptom during or following paroxysmal tachycardia is increased frequency or increased amount of urination, doubtless a nervous reflex.” Friedberg in his first edition (1949) states that “there may be polyuria at the termination of the paroxysm,” but changes this in his second edition (1956) to “during or at the termination of the paroxysm.” Katz and Pick (1956) in a book devoted to the arrhythmias say “Frequency of urination is an unusual symptom in short attacks, but polyuria is often seen after the termination of long ones.” I could find no other mention of polyuria relating to paroxysmal tachycardia in any textbook of cardiology written in the English language—except in the second edition of my own book (1956) where it says “If the heart is normal, there is usually a remarkable degree of polyuria during the attack.”

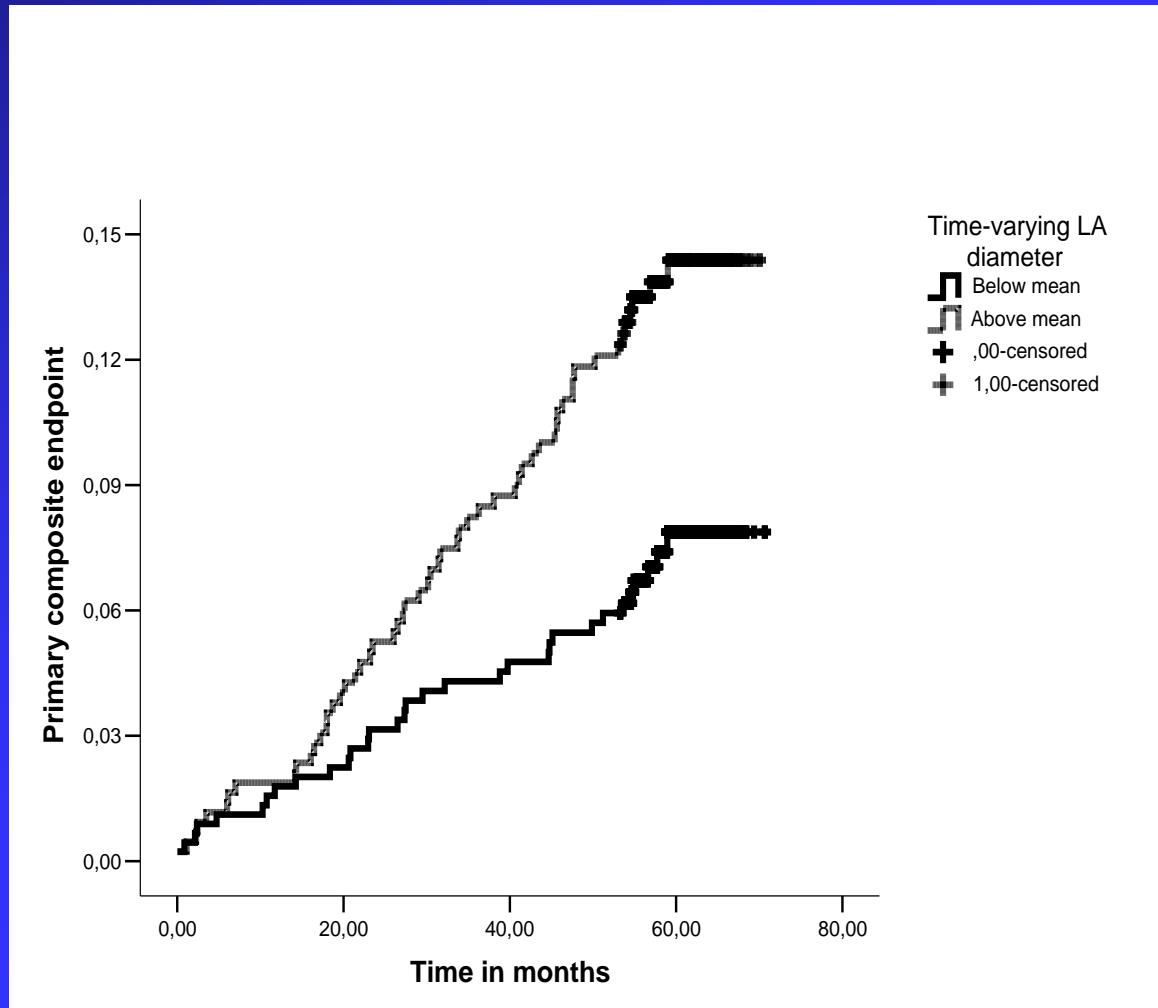

Reeves (1956) induced a large diuresis by distending a balloon in the left atrium, but not by constricting pulmonary veins: the diuresis was reduced by cold block of the vagus. Henry and Pearce

Clinical Correlates in the Community Longitudinal Tracking of Left Atrial Diameter Over the Adult Life Course

1. Low risk group : BMI of 25 kg/m² with normal BP (defined as having a median BP of 113/73)
2. Intermediate risk group: BMI of 27.5 kg/m² and pre-hypertension (defined as having a median BP of 133/86) not receiving anti-hypertensive medications
3. High risk group : BMI of 30 kg/m² and hypertension (defined as having a median BP of 146/91).

The Renal Nerves

- Arise from T10- L1
- Follow the renal artery to the kidney
- Primarily lie within the adventitia

Therapeutic renal denervation of native kidney in ESRD

Baseline

MSNA: 46 burst/min
BP: 155/95 mmHg

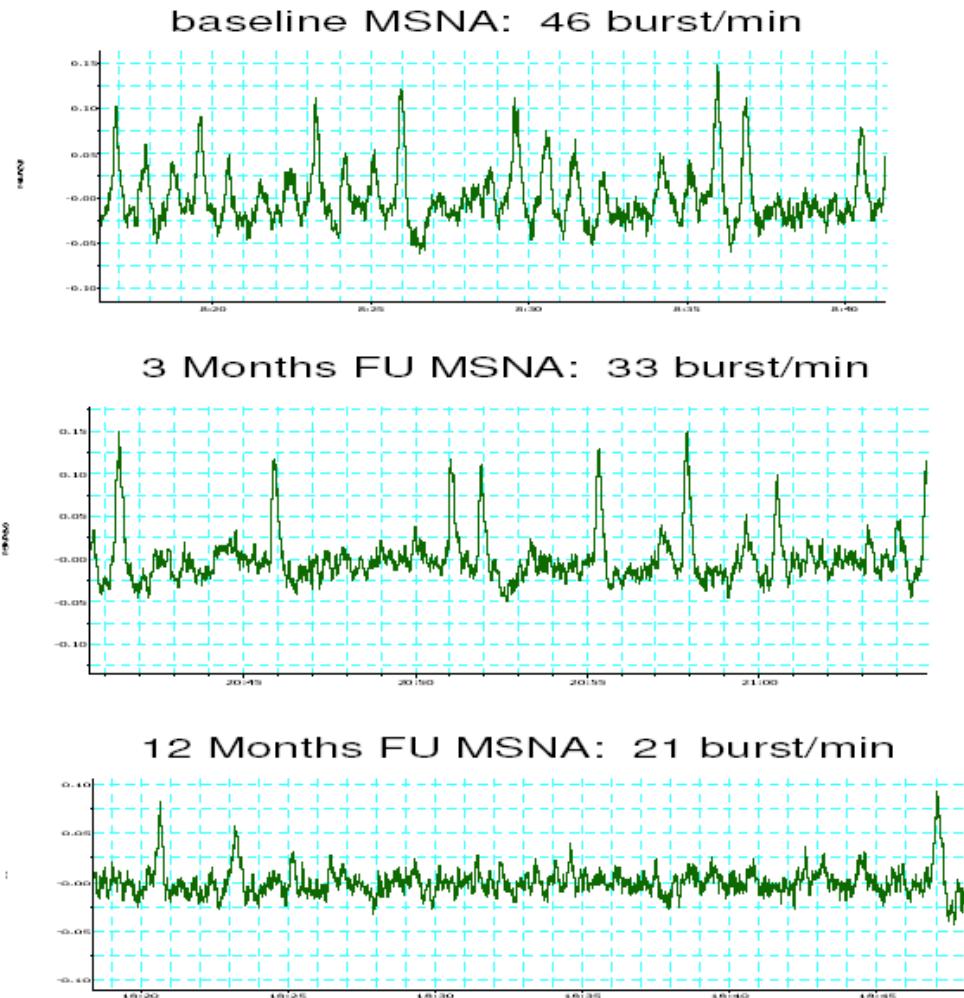

3 Month Follow-up

MSNA: 33 burst/min ($\downarrow \sim 30\%$)
BP: 133/78 mmHg ($\downarrow 22/17 \text{ mmHg}$)

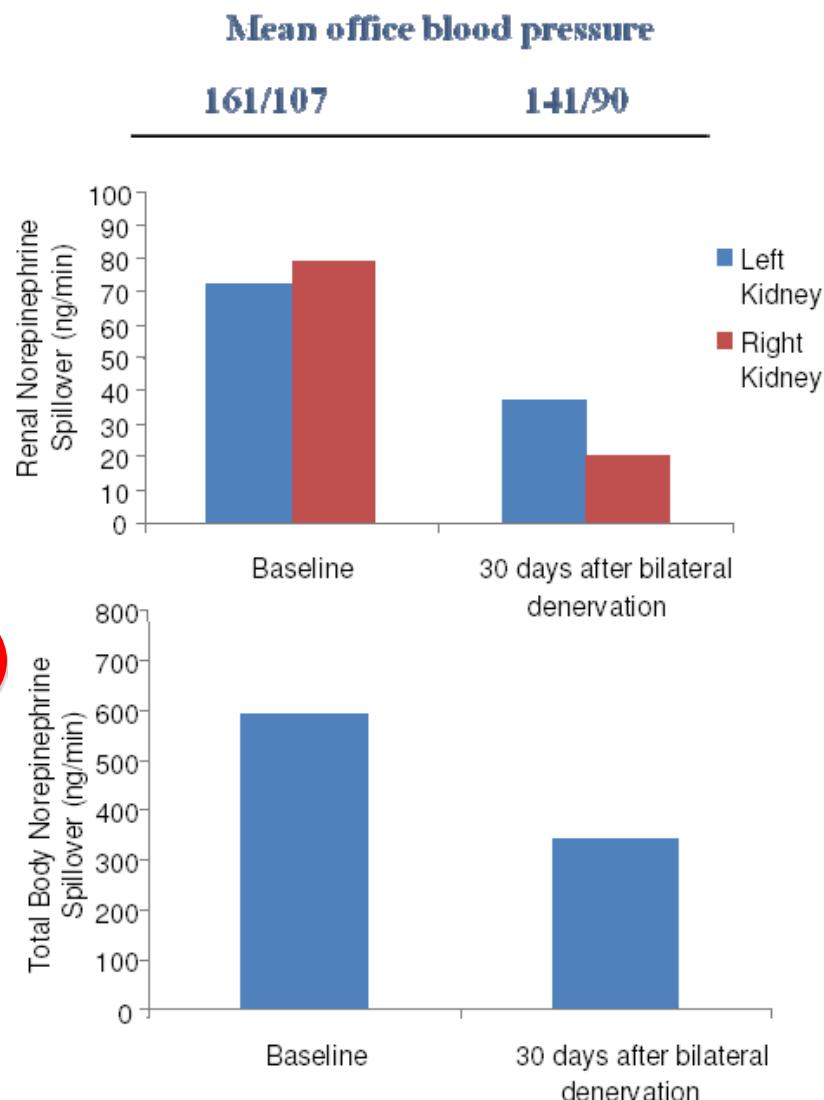

12 Month Follow-up

MSNA: 21 burst/min ($\downarrow \sim 54\%$)
BP: 1328/75 mmHg ($\downarrow 23/20 \text{ mmHg}$)

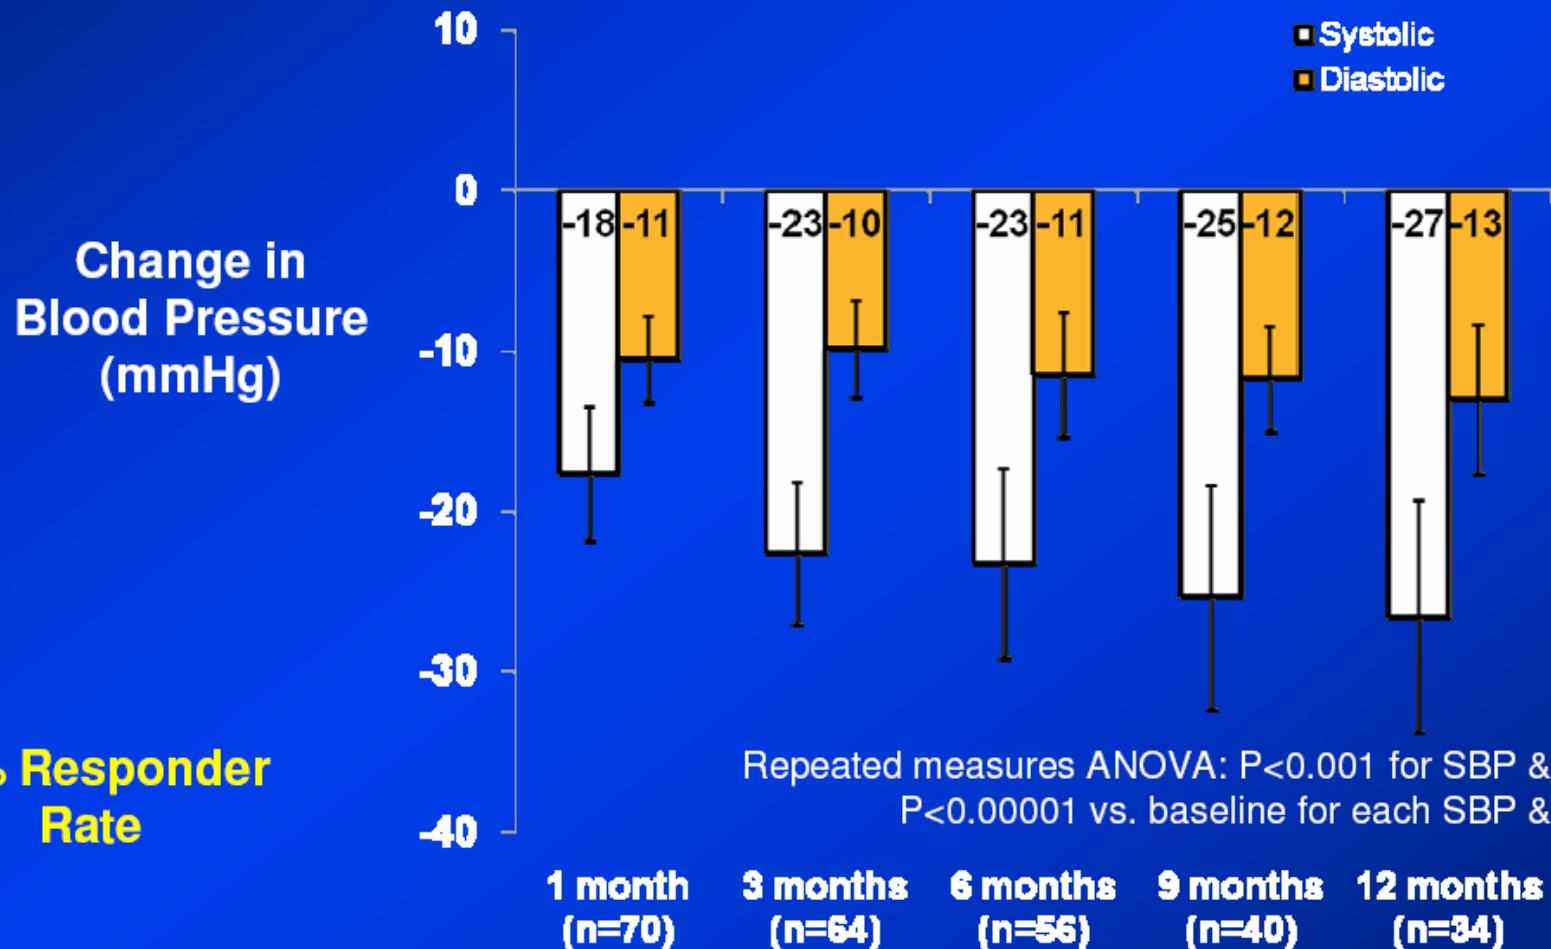

Renal Sympathetic Nerve Ablation for Uncontrolled Hypertension: NEJM Case

- Reduction of Plasma Renin Activity
 - 0.3mcg/l/hr to 0.15 mcg/l/hr
- Increase in Total Renal Plasma Flow
 - 719 ml/min to 1126 ml/min
- Reduction of Renal Norepinephrine Spillover
 - 48% left kidney, 75% right kidney
- Reduction of Total Body Norepinephrine Spillover
 - 42%
- Reduction of Left Ventricular Mass by MRI at 12 months
 - 184g to 169g (78.8g/m² to 73.1g/m²)
- Sustained Reduction in Blood Pressure
 - 161/107 mmHg at baseline
 - 141/90 mmHg at 1 mo
 - 127/81 mmHg at 12 mo (with 2 anti-hypertensive medications removed)

Blood Pressure Response

Full Experience

Symplicity HTN-1: Late Results

Changes in Blood Pressure After Renal Denervation

	2 Years (n =114)	3 Years (n = 34)
Δ Systolic (mm Hg)	- 32.7 ± 18.4	- 33.1 ± 13.3

Patients with office-based SBP \geq 160 mm Hg despite \geq 3 antihypertensive drugs (including 1 diuretic) or \geq 150 mm Hg and type 2 diabetes (34%)

Of patients with < 10 mm Hg drop in SBP at 1 month 64%, 82%, and 100% responded with SBP drop $>$ 10 mm Hg at 1, 2, and 3 years, respectively.

Ziles M et al Circulation 2010;121:1393-1405

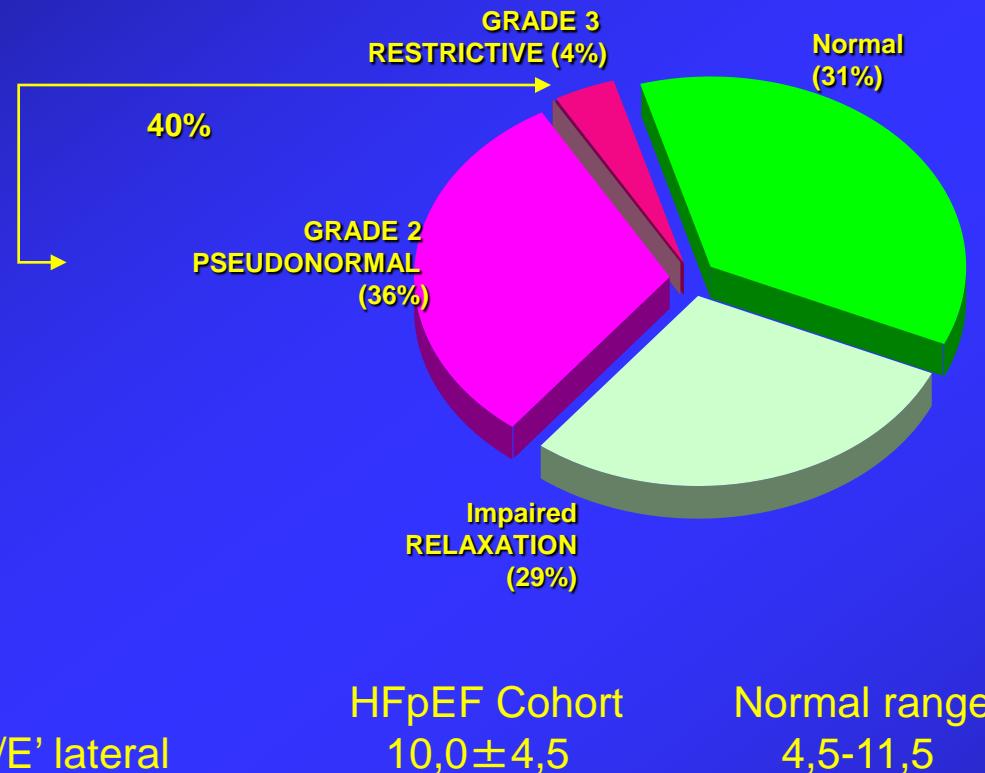

Conclusion

- By reviewed data it's possible to argue that :
 - 1.Atrial function is physiologically related to heart rythm and perfomance, as well as to circulatory volume control via neural (sympathetic and vagal) and neuro-hormonal (ANP) connections with kidney.
 - 2.Kidney is a source and a target of neural activation mediated by atrial connection.
 - 3.Atrial size and kidney function are tightly related to cardiovascular prognosis.
 - 4.By tapering cardiovascular sympathetic tone, renal denervation can effectively decrease atrial propensity to arrhythmia reducing myocardium damage and heart rate when atrial fibrillation occurs.
 - 5.This mechanistic effect may translate in clinical benefit for long term prognosis.

Bilateral nephrectomy for the treatment of hypertension after renal transplantation

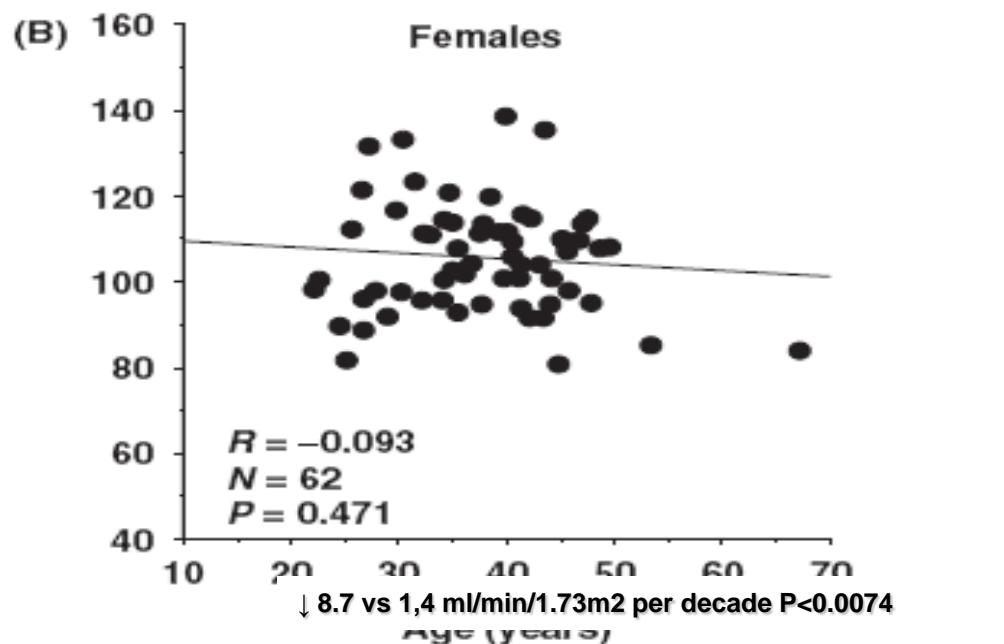

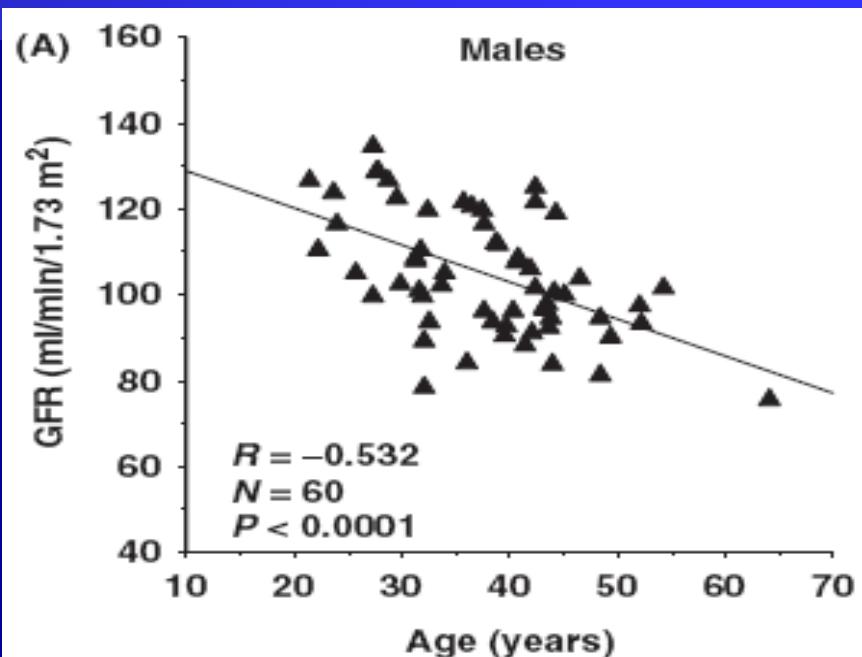

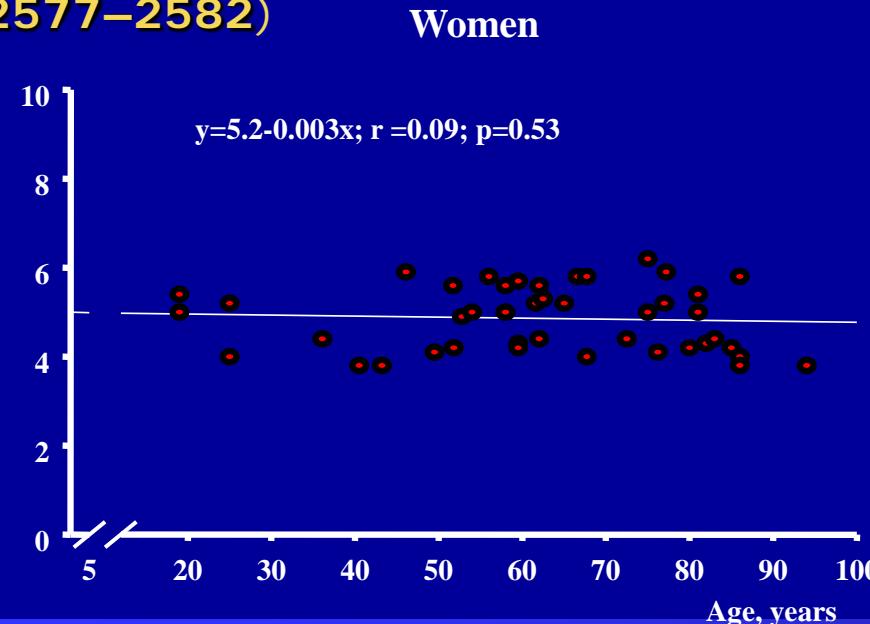

- 14 patients underwent laparoscopic bilateral nephrectomy (BN)
- All patients showed well controlled blood pressure on an decreased antihypertensive drug regime
- Results indicates that bilateral nephrectomy can be an effective alternative method for a selected group of patients with hypertension
