Aortic arch aneurysm: is endovascular choice ready to become gold standard?

Denis Rossato

*Radiologia 3 - Radiologia Vascolare
Città della Salute e della Scienza Torino*

**WORK
IN PROGRESS**

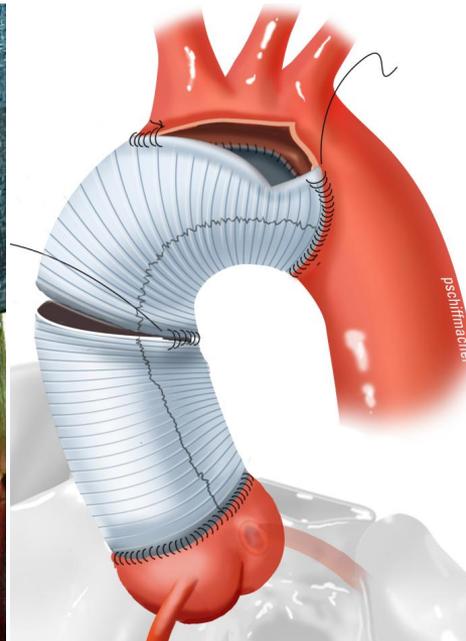

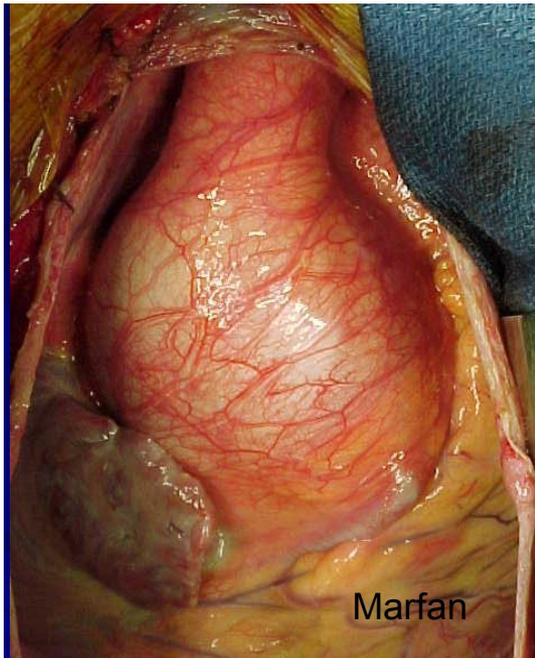

*La riparazione chirurgica open è il gold standard per il trattamento delle patologie dell'arco aortico . A causa della natura invasiva della procedura, che comporta sternotomia o toracotomia, arresto circolatorio ipotermico e bypass cardiopolmonare, molti pazienti sono ritenuti non idonei per la chirurgia . Le riparazioni ibride dell'arco aortico, come la tecnica del »frozen elephant trunk«, riducono i tempi di ischemia cardiaca, ma sono ancora procedure invasive associate a tassi di *ictus* post-operatorio sino al 13% e tassi di mortalità a 30 giorni sino al 12%.*

La riparazione endovascolare dell'aorta toracica (TEVAR) potrebbe essere una valida alternativa minimamente invasiva per i pazienti ritenuti inadatti alla riparazione chirurgica aperta o ibrida. Tuttavia, l'origine delle arterie sopra-aortiche e l'angolazione dell'arco aortico pongono sfide anatomiche per il posizionamento degli endografts .

Pazienti che non devono essere trattati con **TEVAR**:

Zone 0/1

OUTCOME DEI TRATTAMENTI ATTUALMENTE USATI PER PATOLOGIE COMPLESSE DELL'ARCO AORTICO

- Open surgical repair
 - Longer hospital stays
 - Younger, healthier patients

- Endovascular Repair (parallel, branched, and fenestrated)
 - High risk for open repair

- Hybrid Repair
 - High risk for open repair

- Perioperative mortality
 - Open = 8.6% (Leshnowar, 2011)
 - Parallel device = 4.8% (Moulakakis, 2013)
 - Hybrid = 10.8% (Cao, 2012)
- Stroke/neurological events
 - Open = 8.2% (Hiraoka, 2014)
 - Parallel devices = 4% (Moulakakis, 2013)
 - Hybrid = 6.8% (Cao, 2012)
- Reinterventions
 - Open = 9% (Sundt III, 2008)
 - Parallel = 30.8% (Mangialardi, 2014)

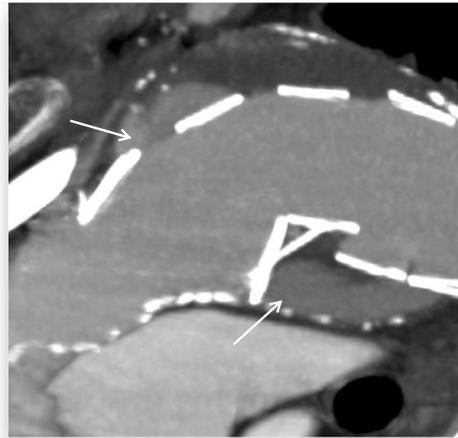

PROBLEMI PER IL TRATTAMENTO ENDOVASCOLARE DELL'ARCO AORTICO

Aumento della pressione e delle forze di migrazione

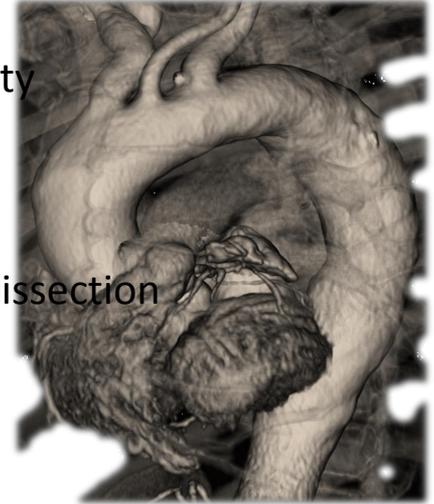

Imaging difficoltoso

Problemi del delivery system

Arterie coronariche e valvola aortica

- ✓ Conformability
- ✓ Endoleak
- ✓ Retrograde dissection
- ✓ Stroke

Piergiorgio Cao, MD, FRCS

Per salvaguardare la pervietà dei vasi epiaortici si possono usare protesi branched o fenestrate (standard o custom)

Thoracic endovascular aortic repair with branched Inoue Stent Graft for arch aortic aneurysms

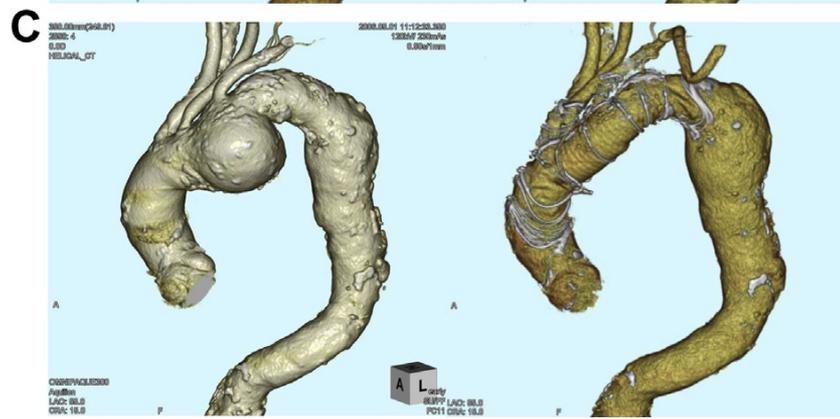

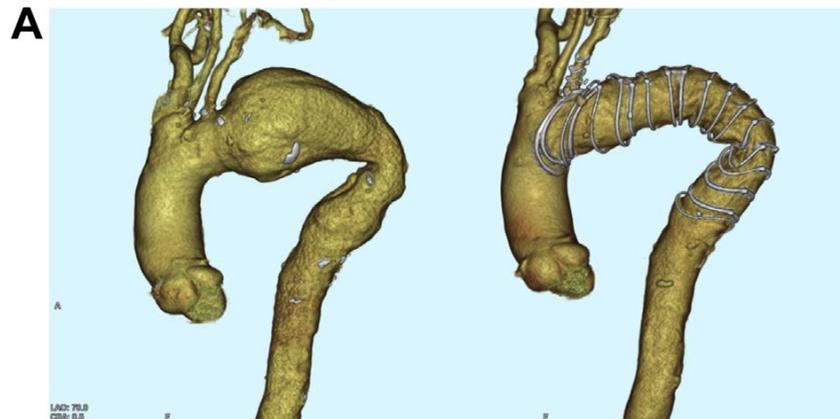

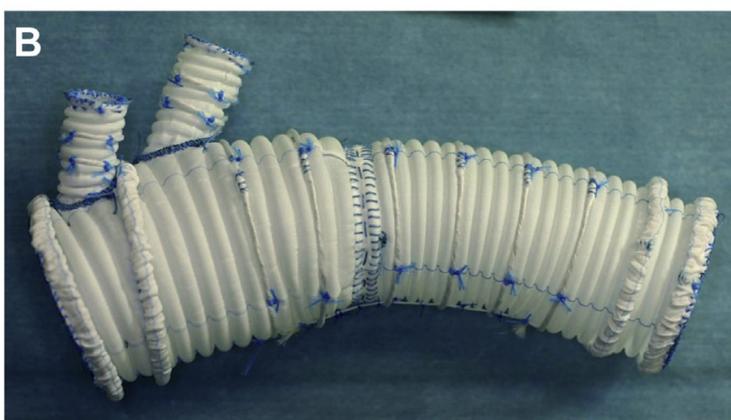

Junichi Tazaki, MD,^a Kanji Inoue, MD,^b Hirooki Higami, MD,^c Nobuya Higashitani, MD,^c Masanao Toma, MD,^d Naritatsu Saito, MD,^a Masahide Kawatou, MD,^e and Takeshi Kimura, MD,^a Kyoto, Otsu, and Amagasaki, Japan

Type of Research: Retrospective analysis of prospectively collected registry data

Take Home Message: Thoracic endovascular aortic repair was performed in 89 consecutive patients for aortic arch aneurysm with branched Inoue Stent Graft with 100% technical success, a mortality of 4.5%, and a periprocedural stroke rate of 7.8% with single-branched device and higher with multiple branches. Freedom from aneurysm-related death at 5 years was 93%.

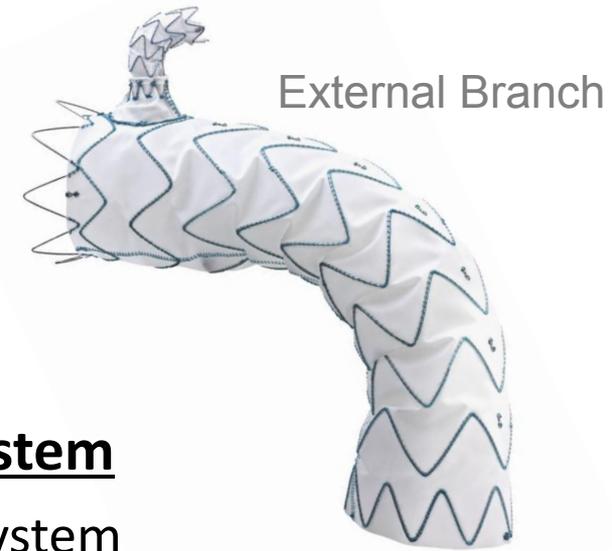

Recommendation: The single-branched Inoue Stent Graft is safe and durable, with acceptable periprocedural complications. ***Caution using multiple branches is warranted.***

	innominate artery posterior	left common carotid artery posterior	subclavian artery posterior
ascending			
	anterior	anterior	anterior
	BCA is half or less-covered with graft.	LCA is preserved by fenestration.	LSCA is full-covered with graft.

Line interval of left figure = 2mm

SG line

Simulation result (Lf value = - 4mm)
Confirmed BCA will be covered by graft more than half.

*SG line = Najuta stent graft's structural baseline along with greater curvature.
* Lf value = Distance between SG line and anterior side edge of fenestration.

SG line

Kawasumi proposal (Lf value = + 4mm)
Would like to propose to adjust fenestration position to be 8mm more posterior side to maintain patency rate of BCA.

Advantage of a precurved fenestrated endograft for aortic arch disease: Simplified arch aneurysm treatment in Japan 2010 and 2011

Yoshihiko Yokoi, MD, Takashi Azuma, MD, and Kenji Yamazaki, MD, PhD

Objective: We evaluated the results of our previous study investigating a precurved fenestrated endograft treatment for thoracic aortic aneurysms and aortic dissection extended to the aortic arch.

Methods: From February 2010 to December 2011 at 35 Japanese centers, 383 patients (mean age, 75.7 ± 9.4 years) who required stent-graft landing in the aortic arch were treated with a precurved fenestrated endograft. The device has 19 3-dimensional curved stent skeleton types similar to aortic arch configurations and 8 graft fenestration types and is 24 to 44 mm in diameter and 16 to 20 cm long. The endografts were fabricated according to preoperative 3-dimensional computed tomographic images.

Results: Technical and initial successes were achieved in 380 and 364 cases, respectively. Device proximal end was at zones 0 to 2 in 363, 15, and 2 patients, respectively. Lesions' proximal end ranged from zone 0 to 3 in 16, 125, 195, and 44 patients, respectively. The mean operative and fluoroscopic times were 161 ± 76 and 26 ± 13 min, respectively. The complications included stroke (7 patients), permanent paralysis (3), and perioperative death (6). No branch occlusion or proximal migration of the device occurred during follow-up.

Conclusions: A precurved fenestrated endograft for endovascular repair in aortic arch disease rendered catheter manipulation simple and minimized operative complication risks. Although most patients had inadequate proximal landing zone and severely angled complex configuration, low mortality and morbidity and satisfactory clinical success were early outcomes, suggesting that this simplified treatment may be effective for aortic arch disease. Conclusioni

Numerosi produttori di dispositivi medici stanno sviluppando endografts branched e fenestrati per il trattamento delle patologie dell'arco aortico con ridotta manipolazione dell'arco e salvataggio dei vasi epiaortici senza necessità di by-pass, fornendo una soluzione minimamente invasiva per i pazienti ritenuti inadatti alla riparazione open dell'arco. L'approccio endovascolare è una valida alternativa alla chirurgia per tutti i pazienti quando morfologicamente fattibile. L'identificazione di una valida zona di atterraggio prossimale resta la preoccupazione maggiore; se non esiste meglio usare protesi fenestrate.

I risultati di F e B-TEVAR sono promettenti, eppure l'ictus rimane la complicanza maggiore periprocedurale predominante.

Per ora, queste procedure dovrebbero essere limitate a Centri selezionati in cui la progettazione e la procedura possono essere ulteriormente sviluppati per un migliore outcome del paziente.
