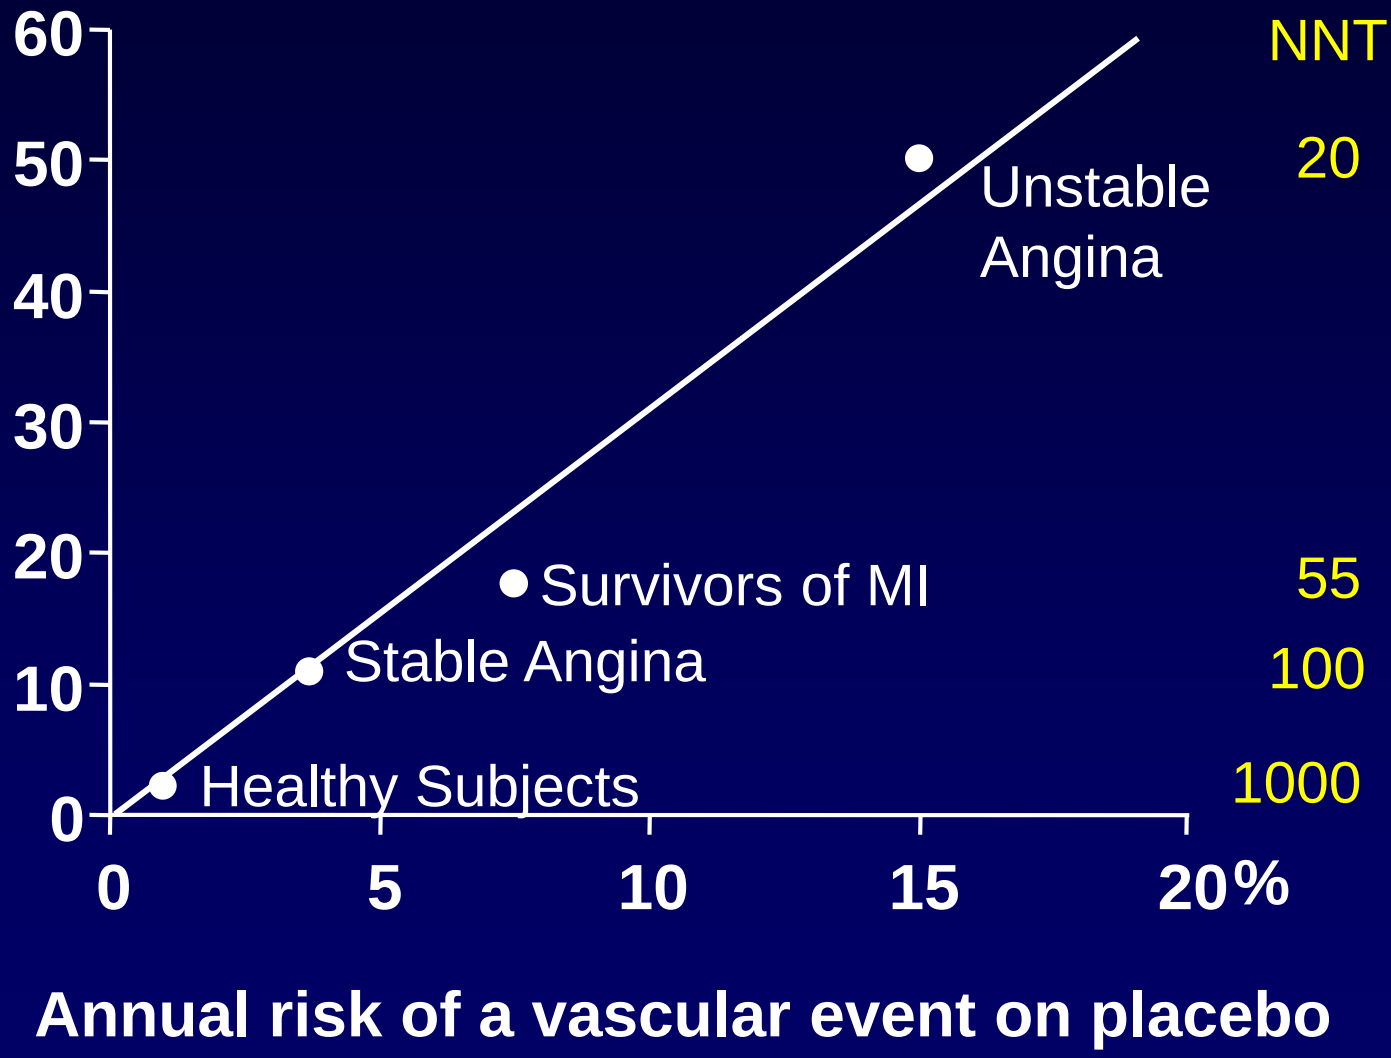
Recommendations for platelet inhibition in NSTE-ACS		
Recommendations	Class[a]	Level[b]
Oral antiplatelet therapy		
Aspirin is recommended for all patients without contra-indications at an initial oral loading dose[c] of 150–300 mg (in aspirin-naïve patients) and a maintenance dose of 75–100 mg daily long-term regardless of treatment strategy.	I	A
A $P2Y_{12}$ inhibitor is recommended, in addition to aspirin, for 12 months unless there are contraindications such as excessive risk of bleeds.	I	A
• Ticagrelor (180 mg loading dose, 90 mg twice daily) is recommended, in the absence of contraindications[d], for all patients at moderate- to high-risk of ischaemic events (e.g. elevated cardiac troponins), regardless of initial treatment strategy and including those pretreated with clopidogrel (which should be discontinued when ticagrelor is started).	I	B
• Prasugrel (60 mg loading dose, 10 mg daily dose) is recommended in patients who are proceeding to PCI if no contraindication.[d]	I	B
• Clopidogrel (300–600 mg loading dose, 75 mg daily dose) is recommended for patients who cannot receive ticagrelor or prasugrel or who require oral anticoagulation.	I	B
$P2Y_{12}$ inhibitor administration for a shorter duration of 3–6 months after DES implantation may be considered in patients deemed at high bleeding risk.	IIb	A
It is not recommended to administer prasugrel in patients in whom coronary anatomy is not known.	III	B
Intravenous antiplatelet therapy		
GPIIb/IIIa inhibitors during PCI should be considered for bailout situations or thrombotic complications.	IIa	C
Cangrelor may be considered in $P2Y_{12}$ inhibitor-naïve patients undergoing PCI.	IIb	A
It is not recommended to administer GPIIb/IIIa inhibitors in patients in whom coronary anatomy is not known.	III	A

The Risk of Vascular Complications is the Major Determinant of the Absolute Benefit of Antiplatelet Therapy

Subjects in whom a vascular event is prevented by aspirin per 1,000 treated for 1 year

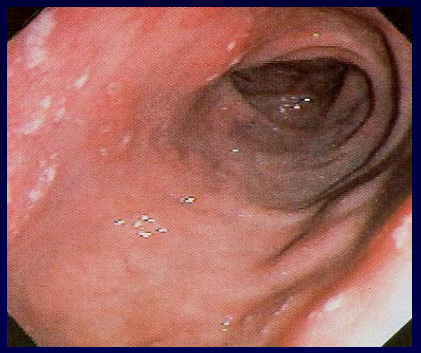


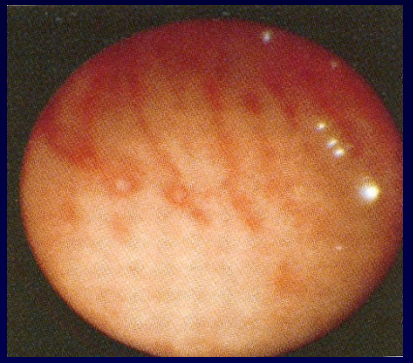
Patrono et al, Chest 2008;133:199S-233S

Gastrointestinal Lesions Induced by NSAIDs

1. Acute Mucosal Lesions:

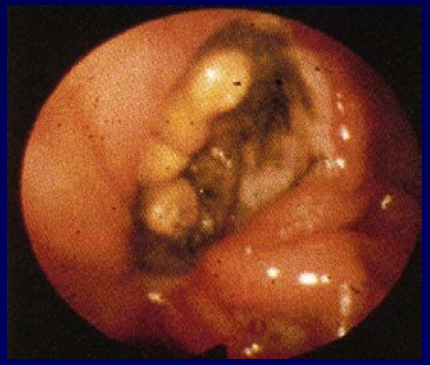
70-90% of patients

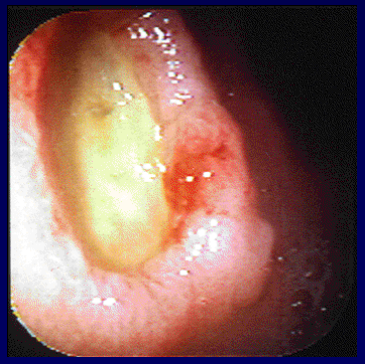




2. Chronic/Deep GD Ulcers

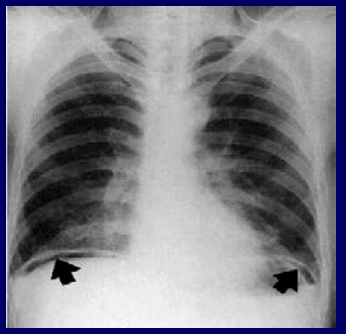
Endoscopic ulcers: 30-50% of patients
Symptomatic ulcers: <10% of patients



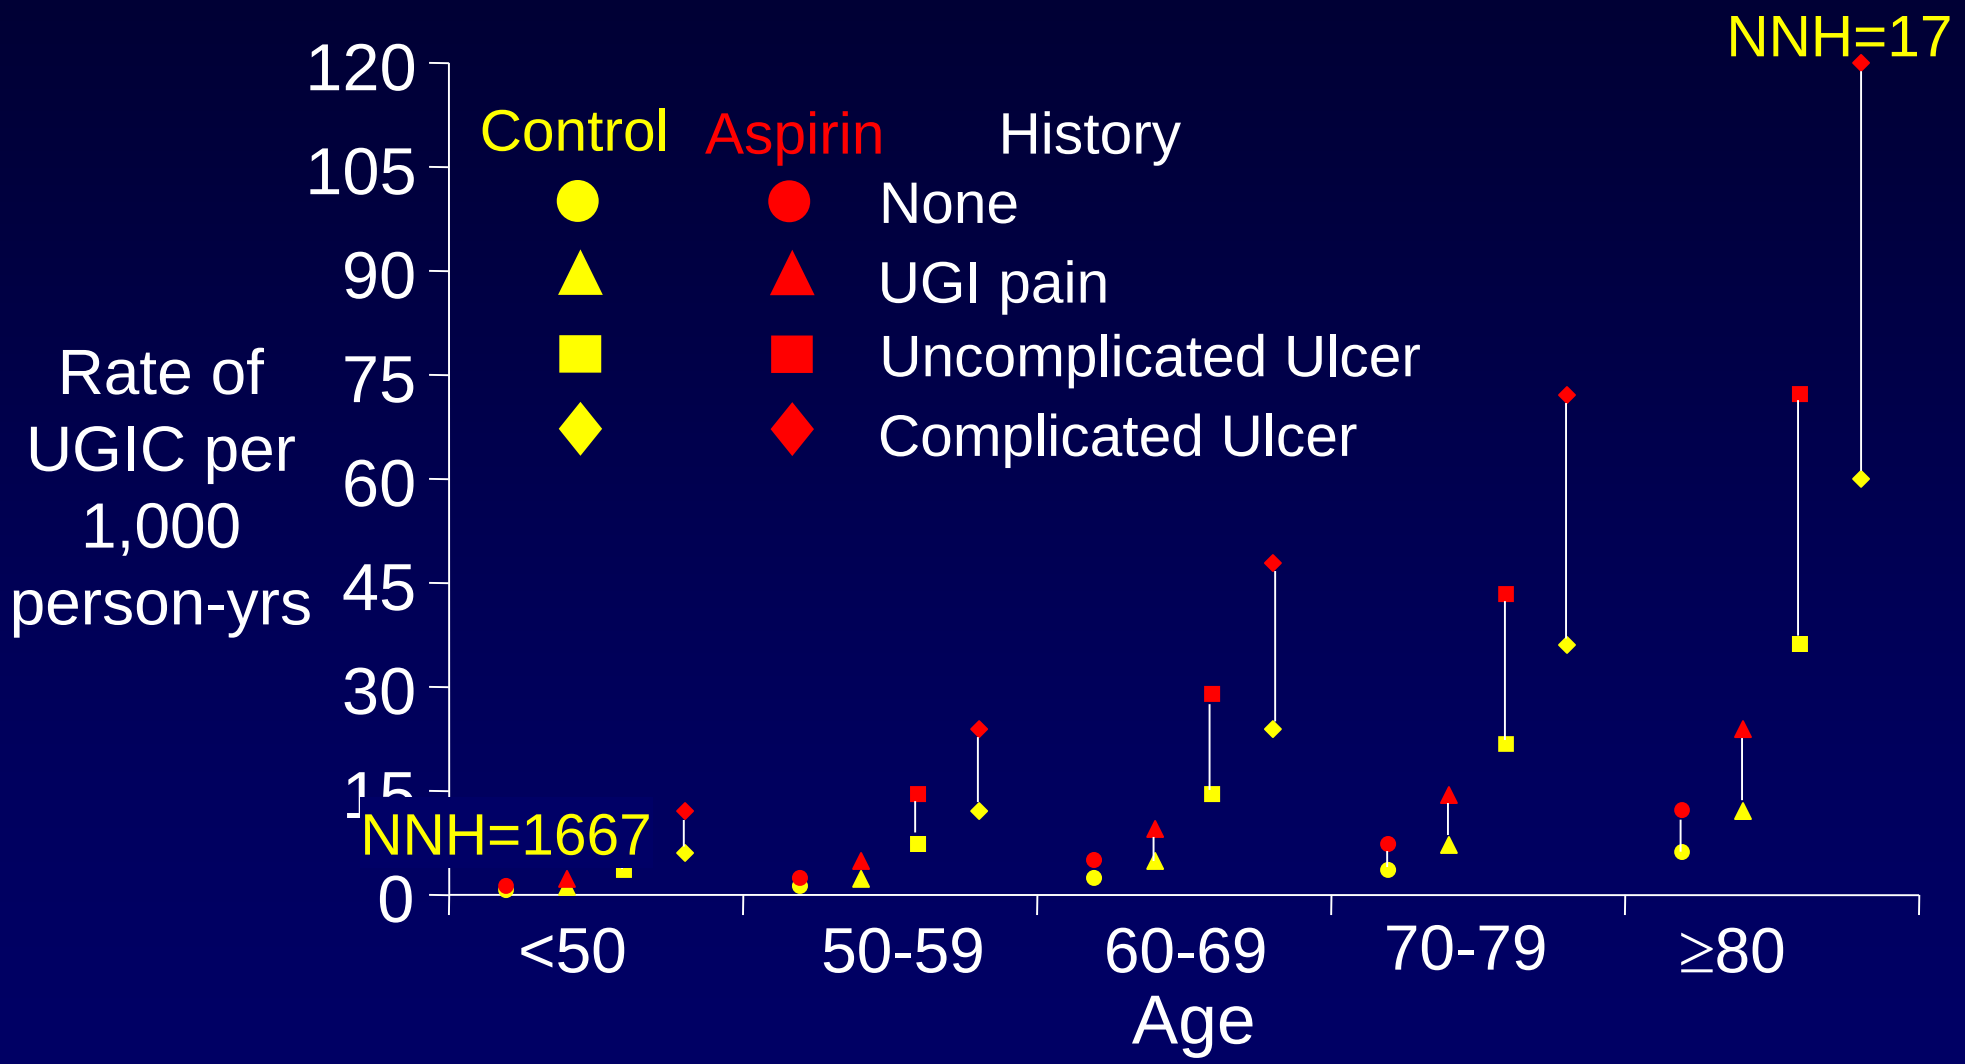


3. Complications:

1-2% of patients

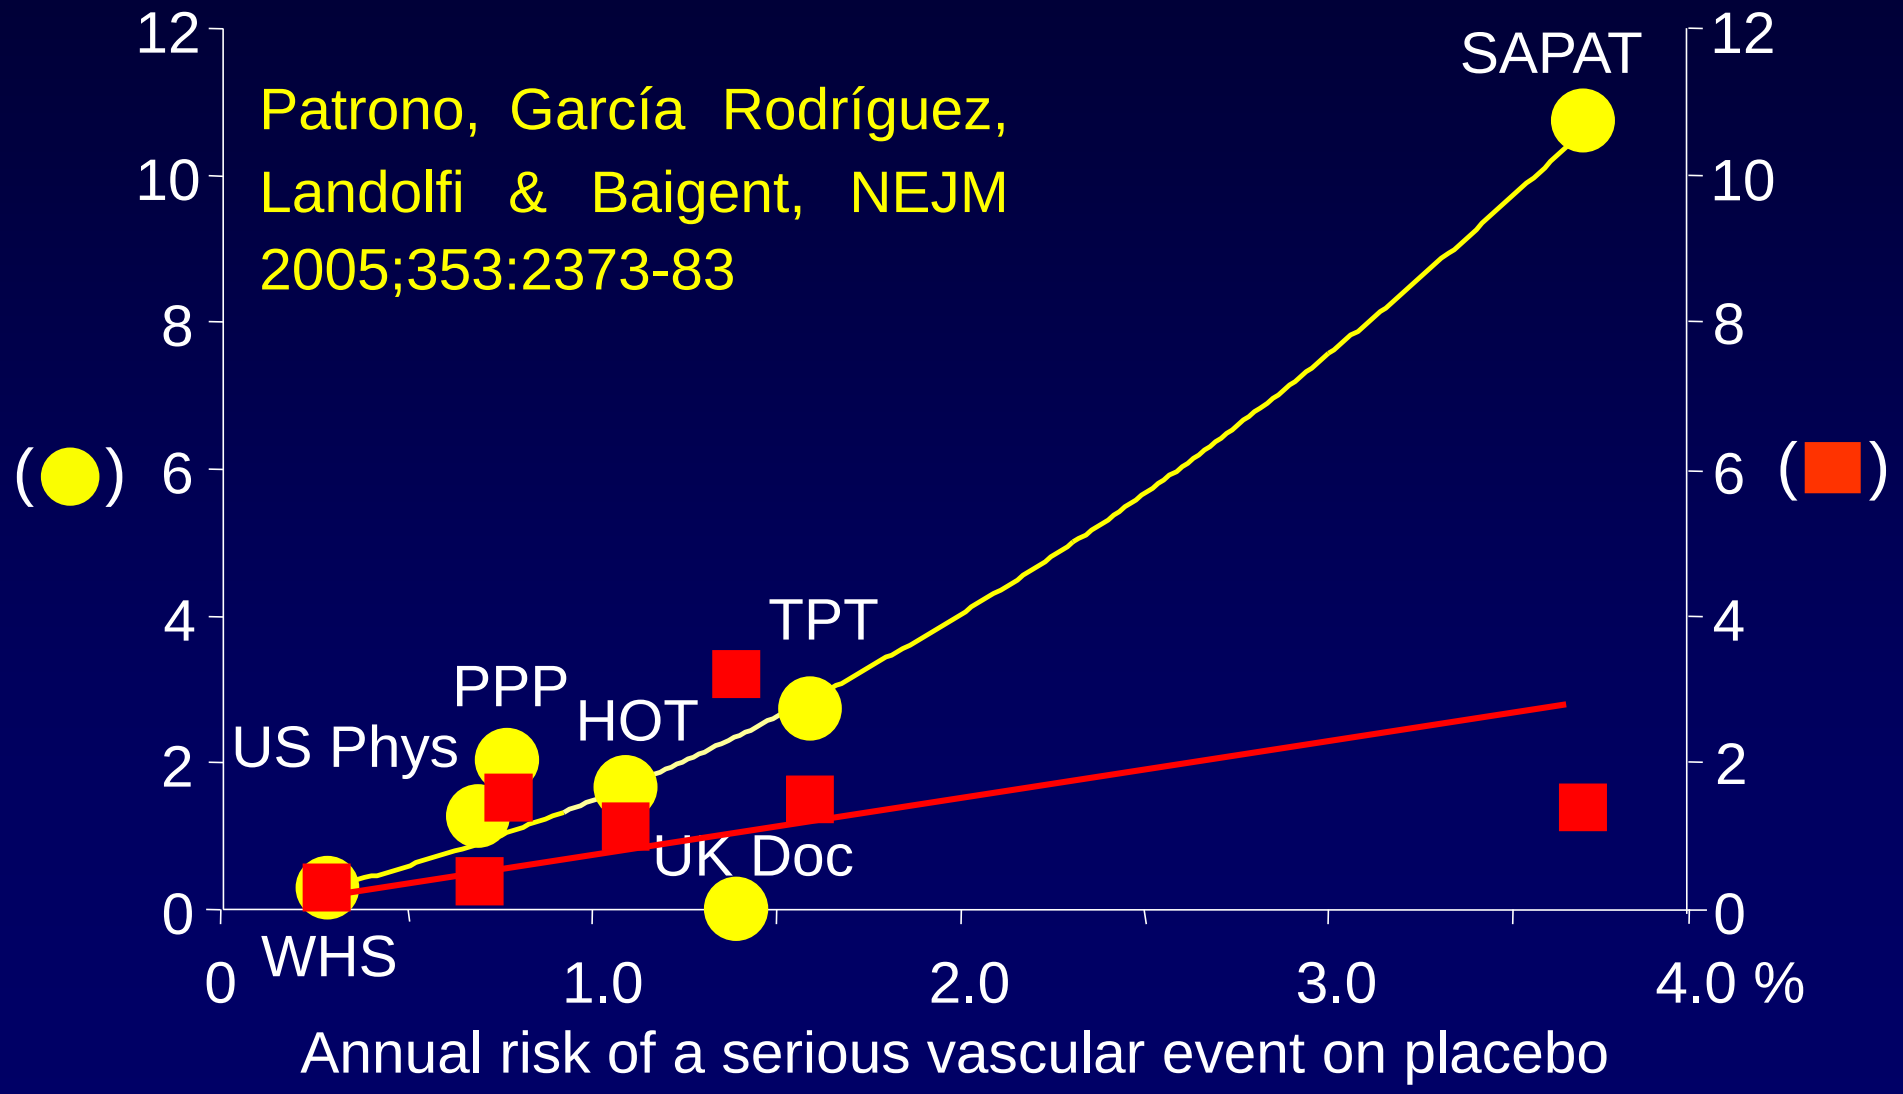


Estimates of UGIC Rates in Male Subjects, as a Function of Age, Prior History and Low-Dose Aspirin

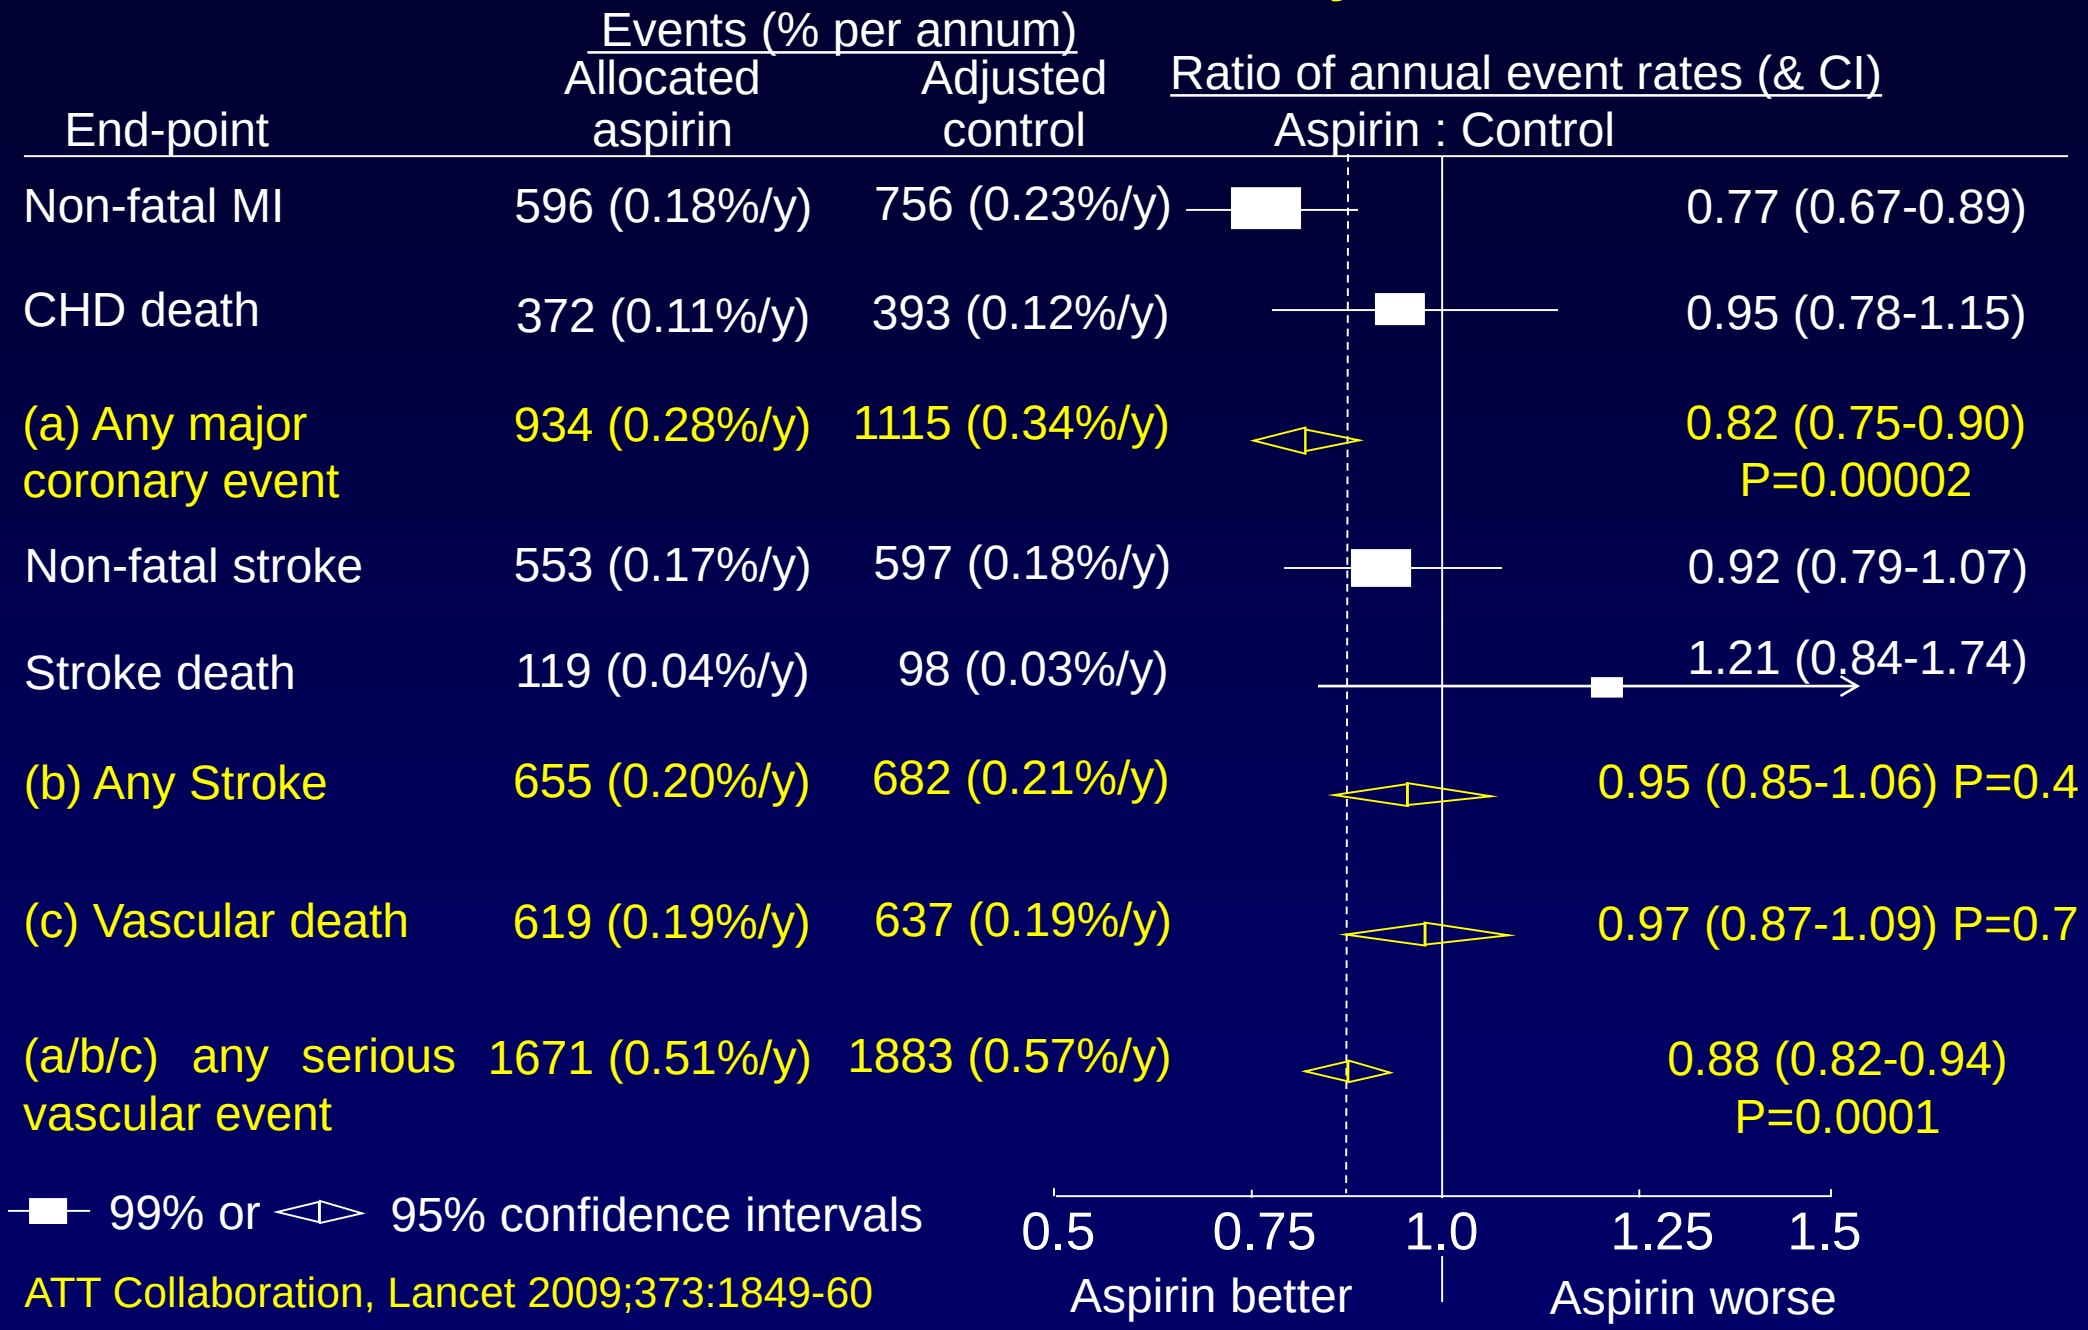


Patrono, García Rodríguez, Landolfi & Baigent, NEJM 2005; 353:2373-83

Vascular Events (●) Avoided vs Major Bleeds (■) Caused per 1,000 Treated with Aspirin per Year



Serious Vascular Events in Primary Prevention Trials



ATT Collaboration, Lancet 2009;373:1849-60

American College of Chest Physicians 2012 Guidelines

For persons aged 50 years or older without symptomatic cardiovascular disease, we suggest low-dose aspirin 75 to 100 mg daily over no aspirin therapy (Grade 2B).

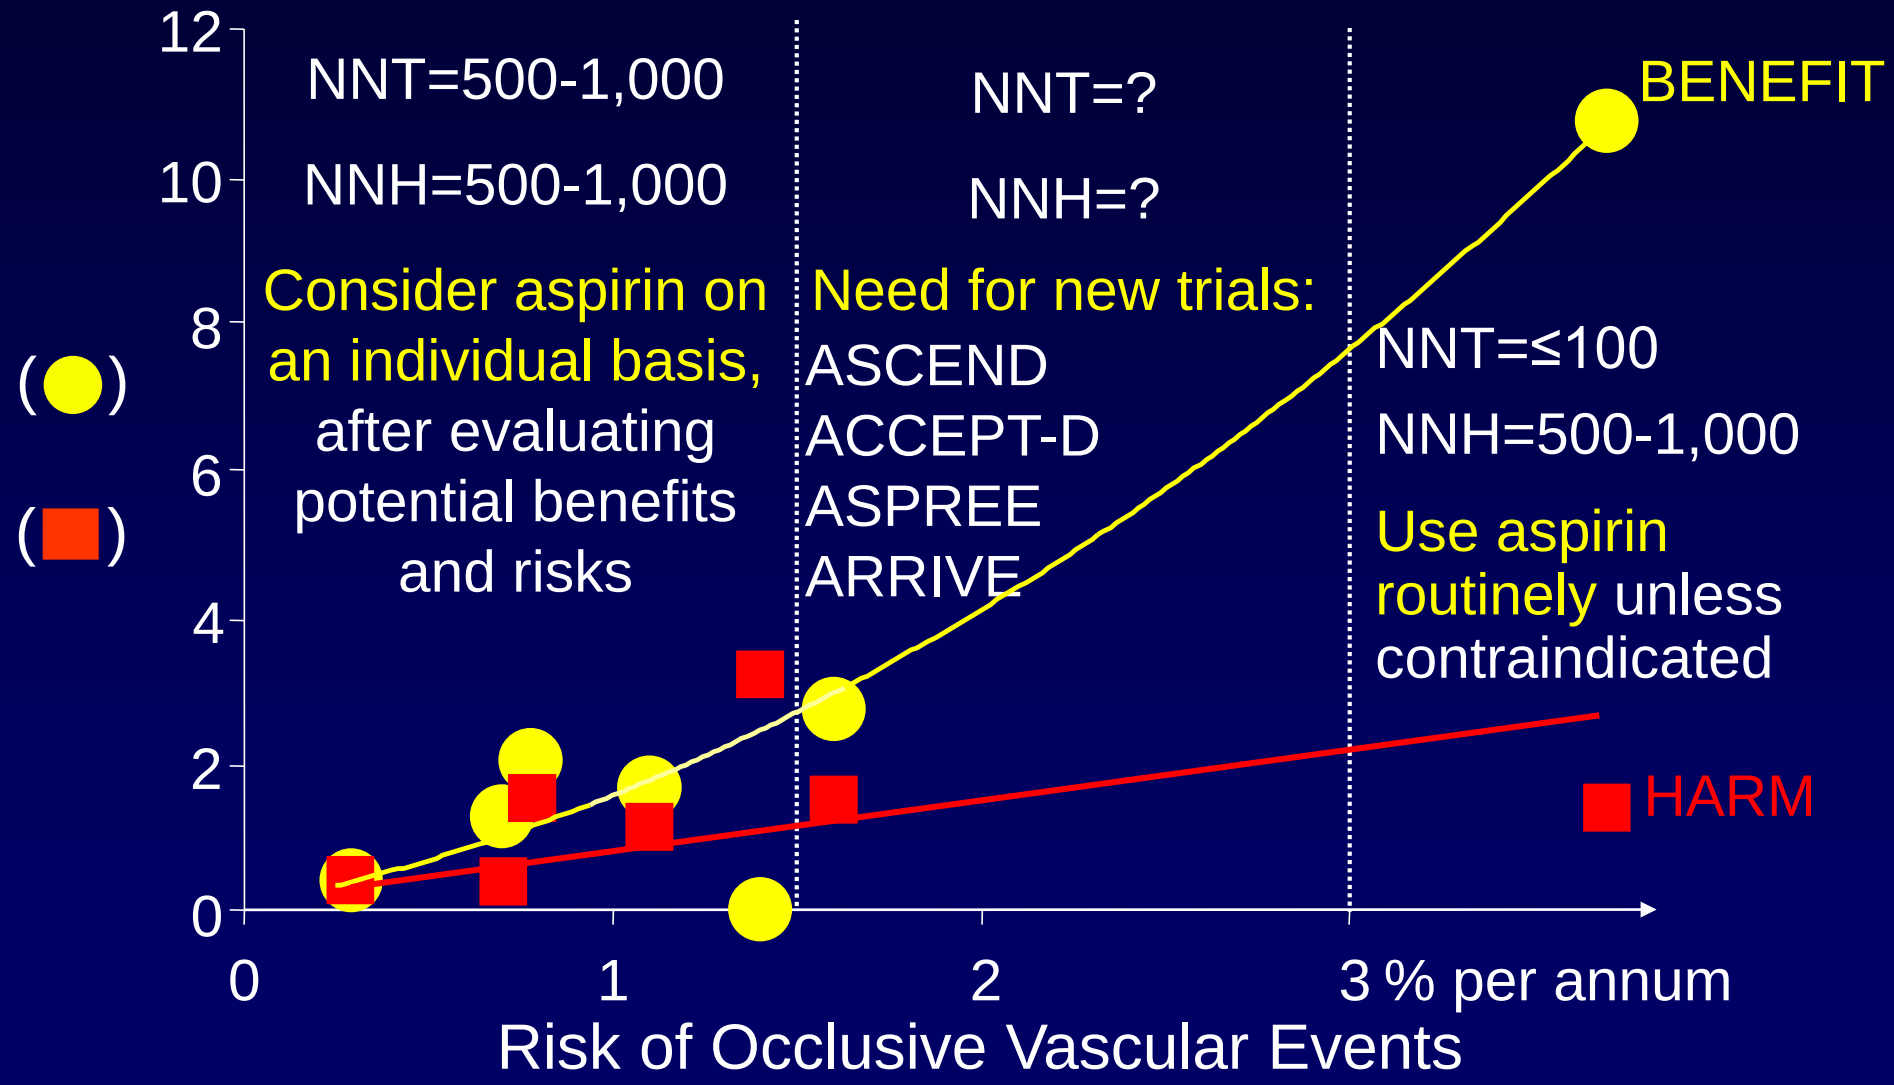
Vandvik et al, CHEST 2012; 141(Suppl):e637S–e668S

European Guidelines on Cardiovascular Disease Prevention in Clinical Practice (version 2012)

Aspirin cannot be recommended in primary prevention due to its increased risk of major bleeding (Grade IIIB).

Perk et al, Eur Heart J 2012; 33:1635-701

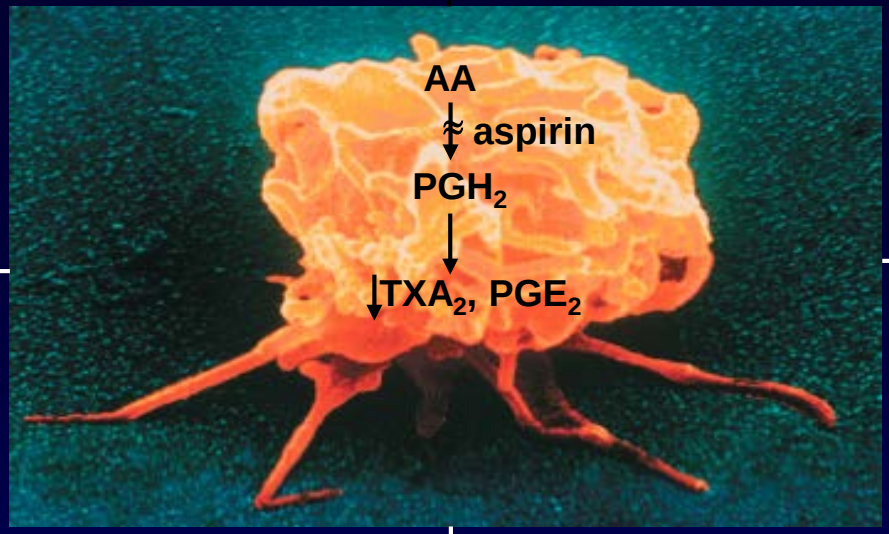
Vascular Events (●) Avoided vs Major Bleeds (■) Caused by Aspirin per 1,000 Treated per Year



Patrono, JACC 2015;66:74-85

Release of microparticles?

Patrono, JACC 2015;66:74-85



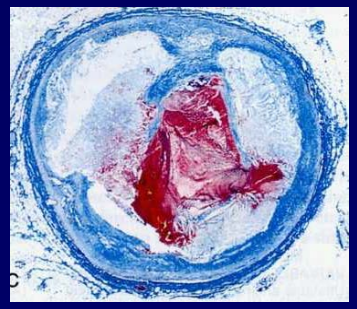
Platelet surface for clotting factors assembly

Release of pro-thrombotic prostanoids

Release of pro-inflammatory, mitogenic and pro-angiogenic autacoids

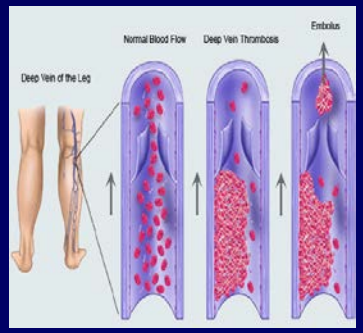
Coronary Atherothrombosis

- Evidence from >50 RCTs and meta-analyses



Venous Thromboembolism

- Evidence from several RCTs and meta-analyses



Colorectal Cancer

- Evidence from observational studies and meta-analyses
- Evidence from post-hoc long-term follow-up of RCTs and meta-analyses
- Currently being tested prospectively in primary prevention and adjuvant RCTs

Cognitive Impairment

- Limited evidence from observational studies
- Currently being tested in the ASPREE primary preventional trial

Draft Recommendation Statement
Aspirin to Prevent Cardiovascular Disease and Cancer

Population	Recommendation	Grade
Adults ages 50 to 59 years	The USPSTF recommends low-dose aspirin use for the primary prevention of cardiovascular disease (CVD) and colorectal cancer in adults ages 50 to 59 years who have a 10% or greater 10-year CVD risk, are not at increased risk for bleeding, have a life expectancy of at least 10 years, and are willing to take low-dose aspirin daily for at least 10 years.	B
Adults ages 60 to 69 years	The decision to use low-dose aspirin to prevent CVD and colorectal cancer in adults ages 60 to 69 years who have a greater than 10% 10-year CVD risk should be an individual one. Persons who are not at increased risk for bleeding, have a life expectancy of at least 10 years, and are willing to take low-dose aspirin daily for at least 10 years are more likely to benefit. Persons who place a higher value on the potential benefits than the potential harms may choose to use low-dose aspirin.	C

U.S. Preventive Services Task Force, September 15, 2015

Ongoing Randomised Trials of Aspirin vs Placebo: Low-Risk Individuals

Study	Regimen(s)	Treatment duration	N	Eligibility	Primary endpoint	Estimated total of all cancers		End date
						≤5 years	>5 years	
ACCEPT-D	A100 vs open control; simvastatin for all	5 y	5170	Diabetes, no CVD	CV death, non-fatal stroke, nonfatal MI, other CV hospitalisation	~300	-	2015
ARRIVE	A100 enteric coated vs P	5y	12,000	10-20% estimated 10y risk of CHD	MI, stroke, CV death, unstable angina, TIA	~800	-	2016
ASPREE	A100 vs P	5 y	19,000	Elderly, no diabetes or CVD	Death, dementia or significant disability	~1000	-	2017
ASCEND	A100 vs P (ω3FA vs P)	7.5 y	15,000	Diabetes, no CVD	MI, stroke or TIA, or CV death	~900	~500 in trial, then registry)	2018

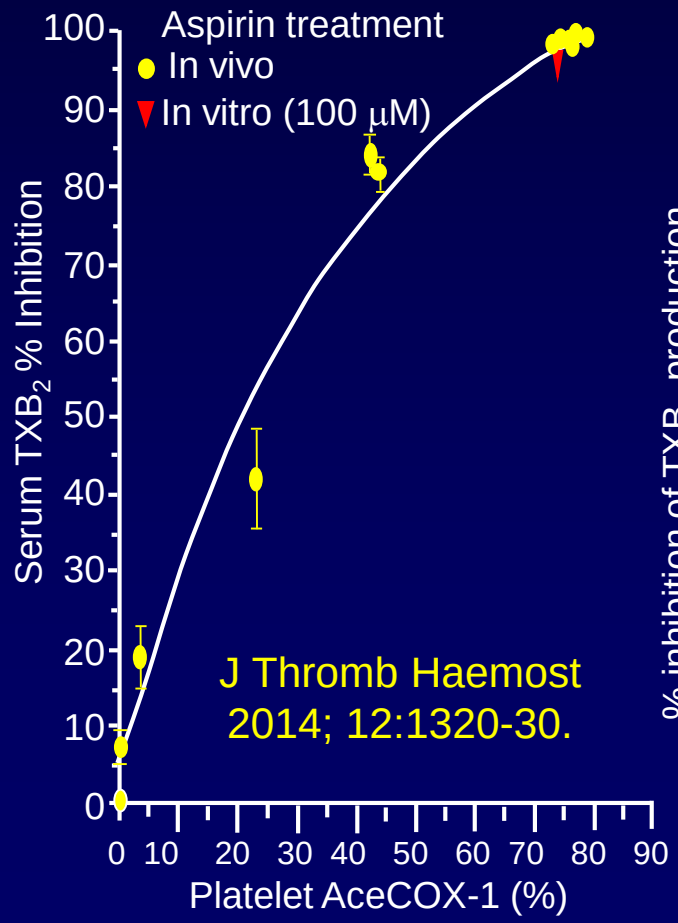
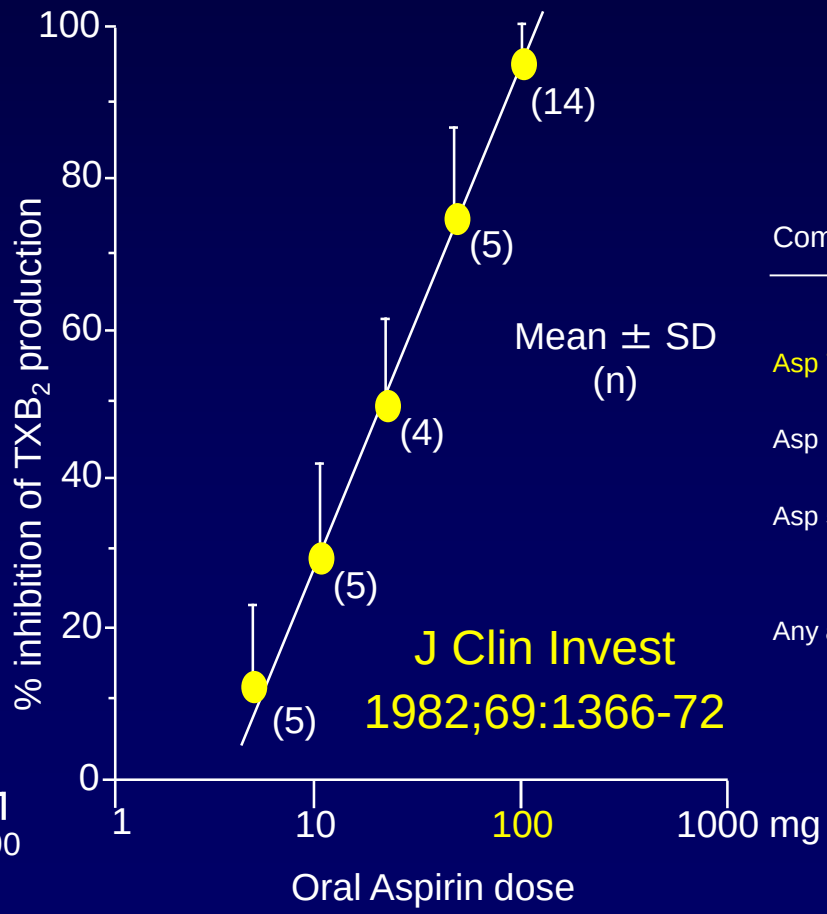
Acetylation of Platelet COX-1, Inhibition of TXA_2 Production and Reduction of Vascular Events by Aspirin are Saturable at Low Doses

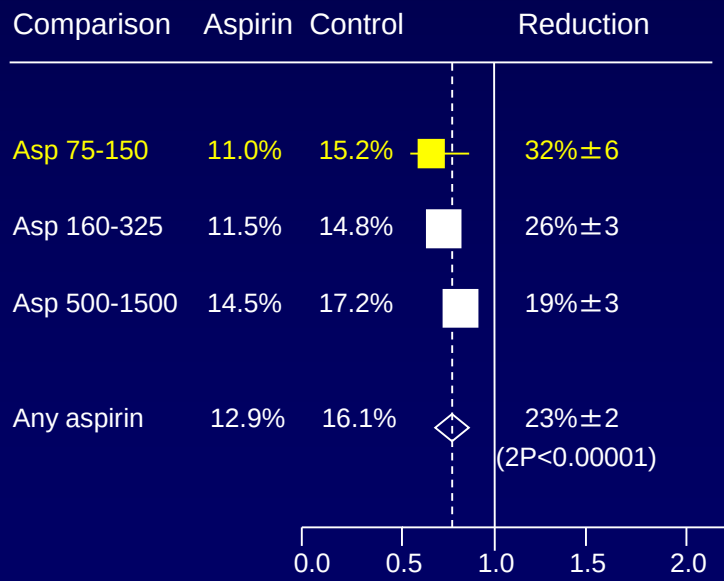
Acetylation of Platelet COX-1



Inhibition of TXA_2 Production



Reduction of Vascular Events in High-Risk Patients



BMJ 2002;324:71-86

Task Force on Antiplatelet Agents of the Working Group on Thrombosis of the European Society of Cardiology

"Hence, the currently available trial results do not seem to justify general guidelines advocating the routine use of aspirin in all asymptomatic individuals above a moderate level of coronary risk, unless additional long-term benefits of antiplatelet therapy become established".

Patrono et al, Eur Heart J 2011; 32:2922-32

Dropping Aspirin?

Pros

1. Reduced risk of bleeding in patients on DAPT
2. Reduced risk of GI damage
3. Reduced risk of inhibiting vascular PGI_2
4. Reduced risk of a pharmacodynamic interaction with ACE-inhibitors.

But

1. Increased risk of coronary atherothrombosis
2. Low-dose aspirin is not gastrotoxic
3. Low-dose aspirin does not inhibit PGI_2 production
4. Low-dose aspirin does not interfere with the antihypertensive effect of ACE-inhibitors.

Aspirin in the Secondary Prevention of CV Disease

From the Office of the Assistant Secretary for Health, U.S. Department of Health and Human Services, Washington, DC (A.K.P.) and Chicago (J.M.G.); the Centers for Disease Control and Prevention, Atlanta (Y.H., J.S.W.); and the Center for Medicare and Medicaid Innovation, Baltimore (J.S.W.).

Parekh et al. N Engl J Med, 2013;368:204-5

Aspirin in the Secondary Prevention of CV Disease

Provision of aspirin to patients with coronary artery disease, atherosclerotic peripheral artery disease, or a history of cerebrovascular disease (transient ischemic attack or stroke) should be the norm; everyone without a contraindication should receive it.

Parekh et al. N Engl J Med, 2013;368:204-5

Aspirin in the Secondary Prevention of CV Disease

Many heart attacks and strokes can be prevented by simplifying the message to both clinicians and their patients with a history of coronary artery disease, peripheral vascular disease, or stroke and no allergy or recent history of bleeding: it's good medicine to take a daily low-dose aspirin.

Parekh et al. N Engl J Med, 2013;368:204-5
